# Supplementary: Kinetic Plasma Dispersion Relation for Arbitrary Distributions under Expansions

Hua-sheng XIE, huashengxie@gmail.com, ENN

Saturday 11<sup>th</sup> January, 2025

### Abstract

This document provides the equations to solve the electromagnetic magnetized non-relativistic kinetic dispersion relation for arbitrary gyrotropic distributions. The distribution functions in the parallel and perpendicular directions are expanded using three types of expansions: Hermite-Hermite (HH), GPDF-Hermite (GH), and GPDF-GPDF (GG) bases. All of these expansions yield rational dispersion relations. For the HH model, by applying rational approximation to the parallel integral plasma dispersion function, we also present the final eigenvalue matrix, which allows for solving all solutions without requiring an initial guess.

# 1 The Kinetic Dispersion Relation

We consider only the electromagnetic magnetized model. In this work, we limit our discussion to linear plasma waves in an infinite, uniform, and homogeneous system. The background magnetic field is assumed to be  $\mathbf{B}_0 = (0, 0, B_0)$ , and the wave vector is given by  $\mathbf{k} = (k_x, 0, k_z) = (k \sin \theta, 0, k \cos \theta)$ , where  $k_{\parallel} = k_z$  and  $k_{\perp} = k_x$ . The plasma consists of S species, indexed by  $s = 1, 2, \dots, S$ . The electric charge, mass, and density of each species are denoted by  $q_s$ ,  $m_s$ , and  $n_{s0}$ , respectively. The dispersion relation is given by [6, 3, 12]

$$\bar{D}(\omega, \mathbf{k}) = |\mathbf{D}(\omega, \mathbf{k})| = |\mathbf{K}(\omega, \mathbf{k}) + (\mathbf{k}\mathbf{k} - k^2\mathbf{I})\frac{c^2}{\omega^2}| = 0,$$

i.e.,

$$\bar{D}(\omega, \mathbf{k}) = \begin{vmatrix}
D_{xx} & D_{xy} & D_{xz} \\
D_{yx} & D_{yy} & D_{yz} \\
D_{zx} & D_{zy} & D_{zz}
\end{vmatrix} = \begin{vmatrix}
K_{xx} - \frac{k_z^2 c^2}{\omega^2} & K_{xy} & K_{xz} + \frac{k_z k_x c^2}{\omega^2} \\
K_{yx} & K_{yy} - \frac{k^2 c^2}{\omega^2} & K_{yz} \\
K_{zx} + \frac{k_z k_x c^2}{\omega^2} & K_{zy} & K_{zz} - \frac{k_x^2 c^2}{\omega^2}
\end{vmatrix} = 0,$$
(1)

where

$$K = I + Q = I - \frac{\sigma}{i\omega\epsilon_0}, \quad Q = -\frac{\sigma}{i\omega\epsilon_0}.$$
 (2)

with

$$\boldsymbol{\sigma} = -i \sum_{s} \frac{q_{s}^{2} n_{s0}}{m_{s}} \sum_{n=-\infty}^{\infty} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - n\omega_{cs} - k_{\parallel} v_{\parallel}} \times \begin{bmatrix} A_{s} \frac{n^{2} v_{\perp}}{\mu_{s}^{2}} J_{n}^{2} & i A_{s} \frac{n v_{\perp}}{\mu_{s}} J_{n} J_{n}' & B_{s} \frac{n v_{\perp}}{\mu_{s}} J_{n}^{2} \\ -i A_{s} \frac{n v_{\perp}}{\mu_{s}} J_{n} J_{n}' & A_{s} v_{\perp} J_{n}'^{2} & -i B_{s} v_{\perp} J_{n} J_{n}' \\ A_{s} \frac{n v_{\parallel}}{\mu_{s}} J_{n}^{2} & i A_{s} v_{\parallel} J_{n} J_{n}' & B_{s} v_{\parallel} J_{n}^{2} \end{bmatrix}, \quad (3)$$

and

$$\mu_{s} = \frac{k_{\perp}v_{\perp}}{\omega_{cs}}, \quad A_{s} = \left(1 - \frac{k_{\parallel}v_{\parallel}}{\omega}\right)\frac{\partial f_{s0}}{\partial v_{\perp}} + \frac{k_{\parallel}v_{\perp}}{\omega}\frac{\partial f_{s0}}{\partial v_{\parallel}}, \quad B_{s} = \frac{n\omega_{cs}v_{\parallel}}{\omega v_{\perp}}\frac{\partial f_{s0}}{\partial v_{\perp}} + \left(1 - \frac{n\omega_{cs}}{\omega}\right)\frac{\partial f_{s0}}{\partial v_{\parallel}}. \tag{4}$$

Eq.(3) is valid for non-relativistic arbitrary gyrotropic distributions. Here,  $J_n = J_n(\mu_s)$  is the Bessel function of the first kind of order n, and its derivative  $J_n' = dJ_n(\mu_s)/d\mu_s$ ,  $J_{n+1}(\mu_s) + J_{n-1}(\mu_s) = \frac{2n}{\mu_s}J_n(\mu_s)$  and  $J_{n+1}(\mu_s) - J_n(\mu_s) = \frac{2n}{\mu_s}J_n(\mu_s)$ 

 $J_{n-1}(\mu_s) = -2J'_n(\mu_s), \ J_{-n} = (-1)^n J_n.$  And,  $\mathbf{n} = \frac{\mathbf{k}c}{\omega}, \ \omega_{cs} = \frac{q_s B_0}{m_s}, \ \omega_{ps} = \sqrt{\frac{n_{s0} q_s^2}{\epsilon_0 m_s}}, \ c = \frac{1}{\sqrt{\mu_0 \epsilon_0}}$  where  $\omega_{ps}$  and  $\omega_{cs}$  are the plasma frequency and cyclotron frequency of each species (note that for electron,  $q_e < 0$  and thus  $\omega_{ce} < 0$ ), c is the speed of light,  $\epsilon_0$  is the permittivity of free space,  $\mu_0$  is the permeability of free space, and n is the refractive

In this work, we write the normalized distribution function of species s to orthogonal basis functions expansion form

$$f_{s0}(v_{\parallel}, v_{\perp}) = \sum_{l=-\infty}^{\infty} \sum_{m=-\infty}^{\infty} a_{s0,lm} W_{sz}(v_{\parallel}) W_{sx}(v_{\perp}) \rho_{sz,l}(v_{\parallel}) u_{sx,m}(v_{\perp}), \quad -\infty < v_{\parallel} < \infty, \quad 0 \le v_{\perp} < \infty, \quad (5)$$

where  $\rho_{sz,l}$  and  $u_{sx,m}$  are basis functions for parallel and perpendicular directions, with  $W_{sz}$  and  $W_{sx}$  be corresponding weight functions, which satisfy

$$\int_{-\infty}^{\infty} W_{sz}(v)\rho_n(v)\rho_{n'}^*(v)dv = A_{sz}\delta_{n,n'}, \quad \int_{-\infty}^{\infty} W_{sx}(v)u_n(v)u_{n'}^*(v)dv = A_{sx}\delta_{n,n'}.$$
 (6)

Thus, we have

$$a_{s0,lm} = \frac{1}{A_{sx}A_{sz}} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f_{s0}(v_{\parallel}, v_{\perp}) \rho_{sz,l}^{*}((v_{\parallel}) h_{sx,m}^{*}(v_{\perp}) dv_{\parallel} dv_{\perp}. \tag{7}$$

Note also that  $\int f_{s0} dv^3 = \int_{-\infty}^{\infty} \int_0^{\infty} 2\pi v_{\perp} f_{s0} dv_{\perp} dv_{\parallel} = 1$ . The advantage of Eq. (5) is that the distribution function  $f_{s0}$  is decoupled into parallel and perpendicular velocity components, allowing the integral in Eq. (3) to be separated for  $v_{\parallel}$  and  $v_{\perp}$ , i.e.,  $f_{s0}(v_{\parallel}, v_{\perp}) = \sum f_l(v_{\parallel}) \cdot f_m(v_{\perp})$ . The performance is largely dependent on the choice of basis functions. Early attempts utilized orthogonal basis functions such as Hermite, Legendre, or Chebyshev polynomials [15]. In practical tests, these basis functions for parallel integration often require high orders for general cases, leading to slow convergence and high computational cost [5].

Fortunately, the Fourier-related rational basis functions introduced by Weideman [11, 16] for parallel integration are found to be both fast and highly accurate for the generalized plasma dispersion function (GPDF) [1]. For this reason, we refer to them as the GPDF basis. Another expansion method involves fitting or interpolating the parallel direction using spline functions and employing Legendre basis functions for the perpendicular direction. This approach has been used for studying wave heating in the ion cyclotron range of frequencies (ICRF) [18, 19].

Our goal is to solve the dispersion relation for arbitrary distributions with high accuracy and to obtain all important solutions without requiring an initial guess. Therefore, it is essential to express the dispersion relation in a rational form with respect to the wave frequency  $\omega$  [2, 12, 17]. Direct grid integration [7, 8, 5] or spline-based fitting [9, 10] cannot yield a rational dispersion relation for  $\omega$ .

By decoupling the distribution function, the solution for the unknown  $\omega$ —given the input parameters  $(k, \theta, \theta)$ etc.)—requires computing the parallel integral iteratively for each  $\omega$ . In contrast, the perpendicular integral only needs to be calculated once. As such, for the perpendicular integral, high-order expansion has little impact on computational speed, whereas for the parallel integral, it is preferable to choose an expansion method that is both accurate and efficient.

To our knowledge, two types of expansions satisfy these requirements: being general for arbitrary distributions and transformable into a matrix method to solve for all solutions. The first type is the GPDF basis [1], which is related to the Fourier basis and exhibits fast, exponentially convergent behavior. It can be transformed into a matrix method similar to the case for  $\kappa$  distributions [14, 13]. The second type is the Hermite basis, which is closely related to the Maxwellian distribution and provides a form suitable for J-pole expansion. This form enables a matrix-based approach [2, 12] with a smaller matrix dimension, allowing for the computation of all solutions without requiring initial guesses.

It is noted that the default GPDF basis may not be suitable for the perpendicular direction because the integral  $\int_0^\infty \frac{x^p}{1+x^2} dx$  diverges for  $p \ge 2$ , requiring modifications. Furthermore, in double-precision floating-point arithmetic, the Hermite basis may not perform well for highly accurate calculations of the parallel direction. However, for most applications, it is advantageous over the GPDF basis due to its smaller required matrix dimension. Quadruple precision can be used for more accurate computations [19].

In this work, we primarily demonstrate the calculation of the dispersion relation and its transformation into a matrix eigenvalue problem to solve for all solutions using Hermite-Hermite (HH) basis functions for the parallel and perpendicular directions, respectively. For the GPDF-Hermite (GH) and GPDF-GPDF (GG) bases, we provide the final dispersion relations but omit the details of the matrix transformation.

# 2 Hermite-Hermite Basis Function Expansion

As previously mentioned, while arbitrary bases can be used for the expansion, selecting an appropriate basis can significantly enhance performance.

## 2.1 Choose the basis function

For simplication, we choose Hermite basis for both parallel and perpendicular direction in this section to demonstrate the performance of our approach, with

$$f_{s0}(v_{\parallel}, v_{\perp}) = \sum_{l=0}^{\infty} \sum_{m=0}^{\infty} a_{s0,lm} \rho_{sz,l}(v_{\parallel}) u_{sx,m}(v_{\perp}), \quad -\infty < v_{\parallel} < \infty, \quad 0 \le v_{\perp} < \infty,$$
 (8)

where  $\rho_{sz,l}$  and  $u_{sx,m}$  are basis functions for parallel and perpendicular directions, with corresponding weight functions  $W_{sz}(v_{\parallel}) = W_{sx}(v_{\perp}) = 1$  are omitted in the above form, which satisfy

$$\int_{-\infty}^{\infty} \rho_{sz,n}(v) \rho_{sz,n'}^*(v) dv = A_{sz} \delta_{n,n'}, \quad \int_{-\infty}^{\infty} u_{sx,n}(v) u_{sx,n'}^*(v) dv = A_{sx} \delta_{n,n'}.$$
 (9)

Here, the asterisk denotes complex conjugation and  $\delta_{n,n'}$  is the Kronechker delta. Thus, we have

$$a_{s0,lm} = \frac{1}{A_{sx}A_{sz}} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f_{s0}(v_{\parallel}, v_{\perp}) \rho_{sz,l}^{*}((v_{\parallel}) u_{sx,m}^{*}(v_{\perp}) dv_{\parallel} dv_{\perp}. \tag{10}$$

We choose Hermite basis for  $v_{\parallel}$  direction

$$\rho_{sz,n}(z) = h_n \left( \frac{\sqrt{2}(z - d_{sz})}{L_{sz}} \right), \quad -\infty < z < \infty, \tag{11}$$

with corresponding velocity widths be  $L_{sz}$  and drift velocity  $d_{sz}$ . Here,  $\sqrt{2}$  is to convinient normalized to Maxwellian case as in BO code[12]. The basis function for perpendicular  $v_{\perp}$  direction is choosen as

$$u_{sx,n}(x) = h_n \left( \frac{\sqrt{2}(x - d_{sx})}{L_{sx}} \right), \quad -\infty < x < \infty, \tag{12}$$

with corresponding velocity widths be  $L_{sx}$  and ring beam velocity  $d_{sx}$ . For most studies, we can set  $d_{sx}=0$ . Note that we have extend  $0 \le v_{\perp} < \infty$  to  $-\infty < v_{\perp} < \infty$ , with  $f_{s0}(v_{\parallel}, v_{\perp}) = f_{s0}(v_{\parallel}, -v_{\perp})$ . Here  $h_n$  is Hermite function

$$h_n(y) = \sqrt{\frac{1}{2^n n! \sqrt{\pi}}} H_n(y) e^{-y^2/2}, \quad \int_{-\infty}^{\infty} h_n(y) h_{n'}(y) dy = \delta_{nn'}, \tag{13}$$

$$H_0(y) = 1$$
,  $H_1(y) = 2y$ ,  $H_2(y) = 4y^2 - 2$ ,  $H_3(y) = 8y^3 - 12y$ , ... (14)

$$H'_n(y) = 2nH_{n-1}(y), \quad H_n(-y) = (-1)^n H_n(y), \quad H_{n+1}(y) = 2yH_n(y) - 2nH_{n-1}(y).$$
 (15)

We have  $A_{sz} = L_{sz}/\sqrt{2}$  and  $A_{sx} = L_{sx}/\sqrt{2}$ . For later more convenient of calculations, we can rewrite the above expansion to the follow form

$$f_{s0}(v_{\parallel}, v_{\perp}) = \sum_{l=0}^{\infty} \sum_{m=0}^{\infty} a_{s0,lm} \rho_{sz,l}(v_{\parallel}) u_{sx,m}(v_{\perp}) = c_{s0} \sum_{l=0}^{\infty} \sum_{m=0}^{\infty} a_{s,lm} \cdot g_{sz,l}(v_{\parallel}) \cdot g_{sx,m}(v_{\perp}), \tag{16}$$

with

$$g_{sz,l}(v_{\parallel}) = \left(\frac{v_{\parallel} - d_{sz}}{L_{sz}}\right)^{l} e^{-\left(\frac{v_{\parallel} - d_{sz}}{L_{sz}}\right)^{2}}, \quad g_{sx,m}(v_{\perp}) = \left(\frac{v_{\perp} - d_{sx}}{L_{sx}}\right)^{m} e^{-\left(\frac{v_{\perp} - d_{sx}}{L_{sx}}\right)^{2}}, \tag{17}$$

and normalized coefficient

$$c_{s0} = \frac{1}{\pi^{3/2} L_{sz} L_{sx}^2 R_s}, \quad R_s = \exp\left(-\frac{d_{sx}^2}{L_{sx}^2}\right) + \frac{\sqrt{\pi} d_{sx}}{L_{sx}} \operatorname{erfc}\left(-\frac{d_{sx}}{L_{sx}}\right), \tag{18}$$

and  $\operatorname{erfc}(-x) = 1 - \operatorname{erf}(-x) = 1 + \operatorname{erf}(x)$  is the complementary error function. After obtaining the coefficients  $a_{s0,lm}$ , it is readily to calculate the coefficients  $a_{s,lm}$ . Note that this new  $g_{sx,m}$  is not orthogonal.

The benefits of the above choice of basis functions include: (1) It naturally reduces to the drift bi-Maxwellian ring beam case [12] by retaining only the lowest-order term with  $a_{s,00} = 1 \neq 0$ . (2) The parallel integral can be expressed with only one Maxwellian Z function, and the perpendicular integral can also be reduced to a single term at the outset. The second benefit allows the J-pole matrix method in BO [12] to be directly applied here, while maintaining the same matrix dimension, even if a larger J is required for accurate computation. This means that a small modification of the Maxwellian-based BO code is sufficient to handle generalized arbitrary distributions.

# 2.2 Calculate the dispersion relation

We define

$$f_{s0,lm}(v_{\parallel}, v_{\perp}) \equiv a_{s,lm} g_{sz,l}(v_{\parallel}) g_{sx,m}(v_{\perp}) = a_{s,lm} f_{s0z,l}(v_{\parallel}) f_{s0x,m}(v_{\perp}), \tag{19}$$

$$f_{s0}(v_{\parallel}, v_{\perp}) = c_{s0} \sum_{l=0}^{\infty} \sum_{m=0}^{\infty} f_{s0,lm}(v_{\parallel}, v_{\perp}), \quad f_{s0z,l}(v_{\parallel}) \equiv g_{sz,l}(v_{\parallel}), \quad f_{s0x,m}(v_{\perp}) \equiv g_{sx,m}(v_{\perp}). \tag{20}$$

Hence, we have

$$\frac{\partial f_{s0,lm}}{\partial v_{\parallel}} = a_{s,lm} f_{s0x,m}(v_{\perp}) \frac{\partial f_{s0z,l}(v_{\parallel})}{\partial v_{\parallel}}, \quad \frac{\partial f_{s0,lm}}{\partial v_{\perp}} = a_{s,lm} f_{s0z,l}(v_{\parallel}) \frac{\partial f_{s0x,m}(v_{\perp})}{\partial v_{\perp}}, \tag{21}$$

$$\frac{\partial f_{s0z,l}(v_{\parallel})}{\partial v_{\parallel}} = -\frac{1}{L_{sz}} \Big[ 2f_{s0z,l+1} - lf_{s0z,l-1} \Big], \tag{22}$$

$$\frac{\partial f_{s0x,m}(v_{\perp})}{\partial v_{\perp}} = -\frac{1}{L_{sx}} \left[ 2f_{s0x,m+1} - mf_{s0x,m-1} \right]. \tag{23}$$

Here, we set  $f_{s0z,l} = f_{s0x,m} = 0$  for all l, m < 0. The above derivatives equations are valid for all  $l, m = 0, 1, 2, \cdots$ . We have also numerically checked the valid of the above two derivatives.

For parallel integral  $[\operatorname{Im}(\zeta_{sn}) > 0]$ , define

$$Z_{l,p}(\zeta_{sn}) \equiv -\frac{k_{\parallel}}{L_{sz}^{p}\sqrt{\pi}} \int_{-\infty}^{\infty} \frac{v_{\parallel}^{p}}{\omega - k_{\parallel}v_{\parallel} - n\omega_{cs}} (\frac{v_{\parallel} - d_{sz}}{L_{sz}})^{l} e^{-(\frac{v_{\parallel} - d_{sz}}{L_{sz}})^{2}} dv_{\parallel} = \frac{1}{\sqrt{\pi}} \int_{-\infty}^{\infty} \frac{g_{l,p}(z)}{z - \zeta_{sn}} dz, \quad g_{l,p}(z) \equiv (z + d)^{p} z^{l} e^{-z^{2}}, (24)$$

we have[1]

$$Z_{0,0}(\zeta) = Z(\zeta), \quad Z_{1,0}(\zeta) = [1 + \zeta Z(\zeta)], \quad Z_{2,0}(\zeta) = \zeta[1 + \zeta Z(\zeta)],$$
 (25)

$$Z_{3,0}(\zeta) = \frac{1}{2} + \zeta^2 [1 + \zeta Z(\zeta)], \quad Z_{l+1,0}(\zeta) = \zeta Z_{l,0} + I_l, \tag{26}$$

$$Z_{l,1} = dZ_{l,0} + Z_{l+1,0}, \quad Z_{l,2} = d^2 Z_{l,0} + 2dZ_{l+1,0} + Z_{l+2,0},$$
 (27)

with  $\zeta_{sn} = \frac{\omega - k_{\parallel} d_{sz} - n\omega_{cs}}{k_{\parallel} L_{sz}}$ ,  $d = \frac{d_{sz}}{L_{sz}}$ , p = 0, 1, 2. And we redefine  $Z_{l,0} \equiv Z_l$  for simplify the notation. Here,  $I_{2l+1} \equiv \pi^{-1/2} \int_{-\infty}^{\infty} x^{2l+1} e^{-x^2} dx = 0$  and  $I_{2l} \equiv \pi^{-1/2} \int_{-\infty}^{\infty} x^{2l} e^{-x^2} dx = \Gamma(l + \frac{1}{2})/\sqrt{\pi}$ , where  $\Gamma$  is Euler Gamma function, and  $I_0 = 1$ ,  $I_{2l} = \frac{2l-1}{2l} I_{2l-2}$ . Here,  $Z_0^{(l)}(\zeta)$  means l-th derivatites of  $Z_0(\zeta)$ . The above functions can be readily[1] calculated to high accuracy used the standard Maxwellian plasma dispersion functions  $Z(\zeta)$ . Also, it can be rewritten to J-pole expansion form[17, 12].

For perpendicular integral

$$\Gamma_{an,m,p}(a_s,d_s) \equiv \frac{1}{L_{sx}^{p+1}} \int_0^\infty v_\perp^p J_n^2 (\frac{k_\perp v_\perp}{\omega_{cs}}) (\frac{v_\perp - d_{sx}}{L_{sx}})^m e^{-(\frac{v_\perp - d_{sx}}{L_{sx}})^2} dv_\perp = \int_0^\infty x^p J_n^2 (a_s x) (x - d_s)^m e^{-(x - d_s)^2} dx,$$

$$\Gamma_{bn,m,p}(a_s,d_s) \equiv \frac{1}{L_{sx}^{p+1}} \int_0^\infty v_\perp^p J_n (\frac{k_\perp v_\perp}{\omega_{cs}}) J_n' (\frac{k_\perp v_\perp}{\omega_{cs}}) (\frac{v_\perp - d_{sx}}{L_{sx}})^m e^{-(\frac{v_\perp - d_{sx}}{L_{sx}})^2} dv_\perp = \int_0^\infty x^p J_n (a_s x) J_n' (a_s x) (x - d_s)^m e^{-(x - d_s)^2} dx,$$

$$\Gamma_{cn,m,p}(a_s,d_s) \equiv \frac{1}{L_{p+1}^{p+1}} \int_0^\infty v_\perp^p J_n'^2 (\frac{k_\perp v_\perp}{\omega_{cs}}) (\frac{v_\perp - d_{sx}}{\omega_{cs}})^m e^{-(\frac{v_\perp - d_{sx}}{L_{sx}})^2} dv_\perp = \int_0^\infty x^p J_n'^2 (a_s x) (x - d_s)^m e^{-(x - d_s)^2} dx.$$

with  $a_s = k_\perp \rho_{cs}$ ,  $d_s = d_{sx}/L_{sx}$ ,  $\rho_{cs} = L_{sx}/\omega_{cs}$ , p = 0, 1, 2, 3. These integrals can be calculated numerically[12]. For  $d_{sx} = 0$ , they are relavant to the modified Bessel functions of the first kind as in the Maxwellian case. Note that we have the normalized condition:  $1 = \int_{-\infty}^{\infty} \int_{0}^{\infty} 2\pi v_\perp f_{s0} dv_\perp dv_\parallel = 2\pi c_{s0} \sum_{l,m} a_{s,lm} \int_{-\infty}^{\infty} \int_{0}^{\infty} v_\perp g_{sz,l} g_{sx,m} dv_\perp dv_\parallel = 2\pi^{3/2} L_{sz} L_{sx}^2 c_{s0} \sum_{l,m} a_{s,lm} I_l \int_{0}^{\infty} x(x-d_s)^m e^{-(x-d_s)^2} dx$ . Hence, we have

$$A_{s} = -c_{s0} \sum_{l} \sum_{m} a_{s,lm} \Big\{ \frac{\omega - k_{\parallel} v_{\parallel}}{\omega} f_{s0z,l} \frac{1}{L_{sx}} [2f_{s0x,m+1} - mf_{s0x,m-1}] + \frac{k_{\parallel} v_{\perp}}{\omega} f_{s0x,m} \frac{1}{L_{sz}} [2f_{s0z,l+1} - lf_{s0z,l-1}] \Big\},$$

$$B_{s} = -c_{s0} \sum_{l} \sum_{m} a_{s,lm} \Big\{ \frac{n\omega_{cs} v_{\parallel}}{\omega v_{\perp}} f_{s0z,l} \frac{1}{L_{sx}} [2f_{s0x,m+1} - mf_{s0x,m-1}] + \frac{\omega - n\omega_{cs}}{\omega} f_{s0x,m} \frac{1}{L_{sz}} [2f_{s0z,l+1} - lf_{s0z,l-1}] \Big\}.$$

Define

$$X_{sn} = \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel}v_{\parallel} - n\omega_{cs}} \times \begin{bmatrix} A_{s} \frac{n^{2}v_{\perp}}{\mu_{s}^{2}} J_{n}^{2} & iA_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n} J_{n}' & B_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n}^{2} \\ -iA_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n} J_{n}' & A_{s} v_{\perp} J_{n}'^{2} & -iB_{s} v_{\perp} J_{n} J_{n}' \\ A_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n}^{2} & iA_{s} v_{\parallel} J_{n} J_{n}' & B_{s} v_{\parallel} J_{n}^{2} \end{bmatrix}.$$
(31)

We have

$$\begin{split} X_{sn11} &= \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times A_{s} \frac{n^{2} v_{\perp}}{\mu_{s}^{2}} J_{n}^{2} = \frac{n^{2} \omega_{cs}^{2}}{k_{\perp}^{2}} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times A_{s} J_{n}^{2} \\ &= -c_{s0} \frac{n^{2} \omega_{cs}^{2}}{k_{\perp}^{2}} \sum_{l} \sum_{m} a_{s,lm} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times \left\{ \frac{\omega - k_{\parallel} v_{\parallel}}{\omega} f_{s0z,l} \frac{1}{L_{sx}} [2f_{s0x,m+1} - mf_{s0x,m-1}] \right. \\ &+ \frac{k_{\parallel} v_{\perp}}{\omega} f_{s0x,m} \frac{1}{L_{sz}} [2f_{s0z,l+1} - lf_{s0z,l-1}] \right\} J_{n}^{2} \\ &= 2 \frac{1}{L_{sz} L_{sx}^{2} R_{s}} \frac{n^{2} \omega_{cs}^{2}}{k_{\perp}^{2}} \sum_{l} \sum_{m} a_{s,lm} \left\{ \left( \frac{\omega}{k_{\parallel}} Z_{l,0} - L_{sz} Z_{l,1} \right) [2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}] + \Gamma_{an,m,1} \frac{L_{sx}^{2}}{L_{sz}} [2Z_{l+1,0} - lZ_{l-1,0}] \right\} \\ &= \frac{2}{R_{s}} \frac{n^{2} \omega_{cs}^{2}}{k_{\perp}^{2} L_{sx}^{2}} \sum_{l} \sum_{m} a_{s,lm} \left\{ \left( \frac{n\omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,0} - Z_{l+1,0} \right) [2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}] + \Gamma_{an,m,1} \frac{L_{sx}^{2}}{L_{sz}^{2}} [2Z_{l+1,0} - lZ_{l-1,0}] \right\} \\ &= \frac{2}{R_{s}} \frac{n^{2} \omega_{cs}^{2}}{k_{\perp}^{2} L_{sx}^{2}} \sum_{l} \sum_{m} a_{s,lm} \left\{ \left( \frac{n\omega_{cs}}{k_{\parallel} L_{sz}} Z_{l} - I_{l} \right) (2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}) + \Gamma_{an,m,1} \frac{L_{sx}^{2}}{L_{sx}^{2}} (2Z_{l+1} - lZ_{l-1}) \right\}, \end{split}$$

$$(32)$$

Here, ' $\rightarrow$ ' means the constant terms  $I_l$  has been summation out for n. We have used  $\sum_{n=-\infty}^{\infty} J_n J_n' = 0$ ,  $\sum_{n=-\infty}^{\infty} n J_n^2 = 0$ ,  $\sum_{n=-\infty}^{\infty} n J_n J_n' = 0$ ,  $\sum_{n=-\infty}^{\infty} J_n^2 = 1$ ,  $\sum_{n=-\infty}^{\infty} (J_n')^2 = \frac{1}{2}$  and  $\sum_{n=-\infty}^{\infty} \frac{n^2 J_n^2}{x^2} = \frac{1}{2}$ . Keep only the l=0, m=0 terms, the above dispersion relation can reduce to the drift bi-Maxwellian ring beam

case[12]. By further set  $d_{sx} = 0$ , it can reduce to the drift bi-Maxwellian case[2].

After the above expansion, the dispersion relation Eq. (1) can be readily solved using conventional iterative rootfinding methods. Since the perpendicular integral  $\Gamma(a_s)$  needs to be calculated only once, and the parallel integrals  $Z(\zeta_{sn})$  are related to the Maxwellian Z function and can be computed efficiently [1, 17], this approach can achieve high-accuracy solutions with reduced computational cost. In principle, this new approach can surpass previous methods [7, 8, 9, 5, 10] in both accuracy and speed. Beyond these advantages, we aim to go further—eliminating the requirement for an initial guess, as implemented in the BO code [2, 12, 14, 13].

#### 2.3Transfrom to Matrix Eigenvalue Problem

We only consider  $k_z \geq 0$  here, for Maxwellian Z function J-pole expansion, we have [12]

$$Z_l(\zeta) \simeq \sum_{j=1}^J \frac{b_j c_j^l}{\zeta - c_j},\tag{33}$$

Here, we have used [17]  $\sum_j b_j = -1$ ,  $\sum_j b_j c_j = 0$ ,  $\sum_j b_j c_j^2 = -1/2$ ,  $\sum_j b_j c_j^3 = 0$ ,  $\cdots$ . This also means that if we need high order Hermite fitting of distribution function, the corresponding coefficients should also keep to similar

order, usually we need set  $J \ge l_{max} + 4$ . To double precision, we have calculated to J = 24. Hence, the present solver can support to  $l_{max} \simeq 20$ . Though higer  $l_{max}$  can also calculate, the accuracy would reduce.

The electromagnetic case is much complicated. However, the linear transformation for  $Q(\omega, \mathbf{k})$  is still similar to the original BO-K/PDRK derivation.

To seek an equivalent linear system, the Maxwell's equations

$$\partial_t \mathbf{E} = c^2 \nabla \times \mathbf{B} - \mathbf{J}/\epsilon_0, \tag{34a}$$

$$\partial_t \mathbf{B} = -\nabla \times \mathbf{E},\tag{34b}$$

do not need to be changed. We only need to seek a new linear system for  $J = \sigma \cdot E$ .

Considering the defination  $\sigma_s = -i\epsilon_0 \omega Q_s = -i\epsilon_0 \frac{\omega_{ps}^2}{\omega_p} P_s$ , after *J*-pole expansion, we have

$$\begin{split} \bullet \ \ P_{s11} &= \sum_{n} \frac{2}{R_s} \frac{n^2 \omega_{cs}^2}{k_\perp^2 L_{sx}^2} \sum_{l,m} a_{s,lm} \Big\{ \big( \frac{n\omega_{cs}}{k_\parallel L_{sz}} Z_l - I_l \big) \big( 2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0} \big) + \Gamma_{an,m,1} \frac{L_{sx}^2}{L_{sz}^2} \big( 2Z_{l+1} - lZ_{l-1} \big) \Big\} \\ &\simeq \sum_{n,j} \frac{2}{R_s} \frac{n^2 \omega_{cs}^2}{k_\perp^2 L_{sx}^2} \frac{k_z L_{sz} b_j}{\omega - c_{snj}} \sum_{l,m} a_{s,lm} \Big\{ \frac{n\omega_{cs}}{k_\parallel L_{sz}} c_j^l \big( 2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0} \big) + \Gamma_{an,m,1} \frac{L_{sx}^2}{L_{sz}^2} \big[ 2c_j^{l+1} - lc_j^{l-1} \big] \Big\} \\ &- \frac{2}{R_s} \frac{\omega_{cs}^2}{k_\perp^2 L_{sx}^2} \sum_{l,m} a_{s,lm} \Big\{ I_l \sum_n n^2 \big( 2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0} \big) \Big\} = \sum_{n,j} \frac{p_{11snj}}{\omega - c_{snj}} - 1 \end{split}$$

$$\bullet \ P_{s13} \simeq \sum_{n,j} \frac{2}{R_s} \frac{n \omega_{cs}}{k_\perp L_{sx}} \frac{k_z L_{sz} b_j}{\omega - c_{snj}} \sum_{l,m} a_{s,lm} \left\{ \frac{n \omega_{cs}}{k_z L_{sx}} (\frac{d_{sz}}{L_{sz}} c_j^l + c_j^{l+1}) (2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}) + \frac{L_{sx}}{L_{sz}} \Gamma_{an,m,1} [(2c_j^{l+2} - lc_j^l) + \frac{d_{sz}}{L_{sz}} (2c_j^{l+1} - lc_j^{l-1})] \right\} = \sum_{n,j} \frac{p_{13snj}}{\omega - c_{snj}}.$$

$$\bullet \ P_{s31} \simeq \sum_{n,j} \frac{2}{R_s} \frac{n\omega_{cs}}{k_{\perp}L_{sx}} \frac{k_zL_{sz}b_j}{\omega - c_{snj}} \sum_{l,m} a_{s,lm} \left\{ \frac{n\omega_{cs}}{k_{\parallel}L_{sx}} (\frac{d_{sz}}{L_{sz}}c_j^l + c_j^{l+1}) (2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}) + \Gamma_{an,m,1} \frac{L_{sx}}{L_{sz}} [2(\frac{d_{sz}}{L_{sz}}c_j^{l+1} + c_j^{l+2}) - l(\frac{d_{sz}}{L_{sz}}c_j^{l-1} + c_j^l)] \right\} = \sum_{n,j} \frac{p_{31snj}}{\omega - c_{snj}}.$$

$$\bullet \ P_{s23} \simeq - \sum_{n,j} \tfrac{2i}{R_s} \tfrac{k_z L_{sz} b_j}{\omega - c_{snj}} \sum_{l,m} a_{s,lm} \bigg\{ \tfrac{n \omega_{cs}}{k_z L_{sx}} (\tfrac{d_{sz}}{L_{sz}} c_j^l + c_j^{l+1}) (2\Gamma_{bn,m+1,1} - m\Gamma_{bn,m-1,1}) + \tfrac{L_{sx}}{L_{sz}} \Gamma_{bn,m,2} [(2c_j^{l+2} - lc_j^l) + \tfrac{d_{sz}}{L_{sz}} (2c_j^{l+1} - lc_j^{l-1})] \bigg\} = \sum_{n,j} \tfrac{p_{23snj}}{\omega - c_{snj}}.$$

$$\bullet \ P_{s32} \simeq \sum_{n,j} \frac{2i}{R_s} \frac{k_z L_{sz} b_j}{\omega - c_{snj}} \sum_{l,m} a_{s,lm} \Big\{ \frac{n\omega_{cs}}{k_\parallel L_{sx}} (\frac{d_{sz}}{L_{sz}} c_j^l + c_j^{l+1}) (2\Gamma_{bn,m+1,1} - m\Gamma_{bn,m-1,1}) + \Gamma_{bn,m,2} \frac{L_{sx}}{L_{sz}} [2(\frac{d_{sz}}{L_{sz}} c_j^{l+1} + c_j^{l+2}) - l(\frac{d_{sz}}{L_{sz}} c_j^{l-1} + c_j^l)] \Big\} = \sum_{n,j} \frac{p_{32snj}}{\omega - c_{snj}}.$$

$$\bullet \ P_{s33} \simeq \sum_{n,j} \frac{2}{R_s} \frac{L_{sz}}{L_{sx}} \frac{k_z L_{sz} b_j}{\omega - c_{snj}} \sum_{l,m} a_{s,lm} \left\{ \frac{n\omega_{cs}}{k_z L_{sx}} (\frac{d_{sz}^2}{L_{sz}} c_j^l + 2\frac{d_{sz}}{L_{sz}} c_j^{l+1} + c_j^{l+2}) (2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}) + \frac{L_{sx}}{L_{sz}} \Gamma_{an,m,1} [(2\frac{d_{sz}}{L_{sz}} c_j^{l+2} + 2c_j^{l+2} - l\frac{d_{sz}}{L_{sz}} c_j^{l+1} + 2c_j^{l+2}) (2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}) + \frac{L_{sx}}{L_{sz}} \Gamma_{an,m,1} [(2\frac{d_{sz}}{L_{sz}} c_j^{l+2} + 2c_j^{l+2} - l\frac{d_{sz}}{L_{sz}} c_j^{l+1} - lc_j^l)] \right\} \\ - \sum_{l} \frac{2}{R_s} \sum_{l,m} a_{s,lm} \left\{ \Gamma_{an,m,1} (2\frac{d_{sz}}{L_{sz}} I_{l+1} + 2c_j^{l+2} - l\frac{d_{sz}}{L_{sz}} I_{l+1} - lI_l) \right\} \\ - 2I_{l+2} - l\frac{d_{sz}}{L_{sz}} I_{l-1} - lI_l) \right\} \\ = -1 + \sum_{n,j} \frac{p_{33snj}}{\omega - c_{snj}}.$$

Here,  $\sum_{n,j} = \sum_{n=-\infty}^{\infty} \sum_{j=1}^{J}$  and  $\sum_{l,m} = \sum_{l} \sum_{m}$ . In the above, say,  $p_{11snj} = \frac{2}{R_s} \frac{n^2 \omega_{cs}^2}{k_{\perp}^2 L_{sx}^2} k_z L_{sz} b_j \sum_{l,m} a_{s,lm} \left\{ \frac{n\omega_{cs}}{k_{\parallel} L_{sz}} c_j^l (2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}) + \Gamma_{an,m,1} \frac{L_{sx}^2}{L_{sz}^2} [2c_j^{l+1} - lc_j^{l-1}] \right\}$ , and other terms are similar.

It is thus easy to find that after J-pole expansion, the relations between J and E has the following form

$$\begin{pmatrix} J_{x} \\ J_{y} \\ J_{z} \end{pmatrix} = -i\epsilon_{0} \begin{pmatrix} \frac{b_{11}}{\omega} + \sum_{snj} \frac{b_{snj11}}{\omega - c_{snj}} & \frac{b_{12}}{\omega} + \sum_{snj} \frac{b_{snj12}}{\omega - c_{snj}} & \frac{b_{13}}{\omega} + \sum_{snj} \frac{b_{snj13}}{\omega - c_{snj}} \\ \frac{b_{21}}{\omega} + \sum_{snj} \frac{b_{snj21}}{\omega - c_{snj}} & \frac{b_{22}}{\omega} + \sum_{snj} \frac{b_{snj22}}{\omega - c_{snj}} & \frac{b_{23}}{\omega} + \sum_{snj} \frac{b_{snj23}}{\omega - c_{snj}} \\ \frac{b_{31}}{\omega} + \sum_{snj} \frac{b_{snj31}}{\omega - c_{snj}} & \frac{b_{22}}{\omega} + \sum_{snj} \frac{b_{snj22}}{\omega - c_{snj}} & \frac{b_{33}}{\omega} + \sum_{snj} \frac{b_{snj33}}{\omega - c_{snj}} \end{pmatrix} \begin{pmatrix} E_{x} \\ E_{y} \\ E_{z} \end{pmatrix}.$$
 (35)

with the coefficients

$$\begin{cases} b_{snj11} = \omega_{ps}^2 p_{11snj}/c_{snj}, \ b_{11} = -\sum_s \omega_{ps}^2 \left[ \sum_n \frac{2}{R_s} \frac{\omega_{cs}^2}{k_\perp^2 L_{sx}^2} \sum_{l,m} a_{s,lm} \left\{ I_l \sum_n n^2 (2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}) \right\} + \sum_{nj} p_{11snj}/c_{snj} \right], \\ b_{snj12} = \omega_{ps}^2 p_{12snj}/c_{snj}, \ b_{12} = -\sum_s \omega_{ps}^2 \left[ \sum_{nj} p_{12snj}/c_{snj} \right], \\ b_{snj21} = \omega_{ps}^2 p_{21snj}/c_{snj}, \ b_{21} = -\sum_s \omega_{ps}^2 \left[ \sum_{nj} p_{21snj}/c_{snj} \right], \\ b_{snj22} = \omega_{ps}^2 p_{22snj}/c_{snj}, \ b_{22} = -\sum_s \omega_{ps}^2 \left[ \sum_n \frac{2}{R_s} \sum_{l,m} a_{s,lm} \left\{ I_l (2\Gamma_{cn,m+1,2} - m\Gamma_{cn,m-1,2}) \right\} + \sum_{nj} p_{22snj}/c_{snj} \right], \\ b_{snj13} = \omega_{ps}^2 p_{13snj}/c_{snj}, \ b_{13} = -\sum_s \omega_{ps}^2 \left[ \sum_{nj} p_{13snj}/c_{snj} \right], \\ b_{snj31} = \omega_{ps}^2 p_{23snj}/c_{snj}, \ b_{23} = -\sum_s \omega_{ps}^2 \left[ \sum_{nj} p_{23snj}/c_{snj} \right], \\ b_{snj23} = \omega_{ps}^2 p_{23snj}/c_{snj}, \ b_{23} = -\sum_s \omega_{ps}^2 \left[ \sum_{nj} p_{23snj}/c_{snj} \right], \\ b_{snj32} = \omega_{ps}^2 p_{32snj}/c_{snj}, \ b_{32} = -\sum_s \omega_{ps}^2 \left[ \sum_{nj} p_{23snj}/c_{snj} \right], \\ b_{snj33} = \omega_{ps}^2 p_{33snj}/c_{snj}, \ b_{33} = -\sum_s \omega_{ps}^2 \left[ \sum_n \frac{2}{R_s} \sum_{l,m} a_{s,lm} \left\{ \Gamma_{an,m,1} (2\frac{l_{sz}}{l_{sz}} I_{l+1} + 2I_{l+2} - l\frac{d_{sz}}{l_{sz}} I_{l-1} - lI_l) \right\} + \sum_{nj} p_{33snj}/c_{snj} \right], \\ c_{snj} = k_z v_{dsz} + n\omega_{cs} + k_z v_{zts} c_j. \end{cases}$$
(36)

In numerical test, considering the cutoff of summation n, i.e.,  $\sum_{n} = \sum_{n=-N}^{N}$  with  $N \neq \infty$ , we find the above original form of  $b_{11}$ ,  $b_{22}$  and  $b_{33}$ , converges faster (i.e., can use smaller N to obtain convergent results) than the below form

$$\begin{cases}
b_{11} = -\sum_{s} \omega_{ps}^{2} [1 + \sum_{nj} p_{11snj}/c_{snj}], \\
b_{22} = -\sum_{s} \omega_{ps}^{2} [1 + \sum_{nj} p_{22snj}/c_{snj}], \\
b_{33} = -\sum_{s} \omega_{ps}^{2} [1 + \sum_{nj} p_{33snj}/c_{snj}].
\end{cases} (37)$$

It is readily to see that all the singularities from  $\frac{1}{k_z}$  in  $P_s$  are removable. The  $\frac{n\omega_{rs}}{k_x}$  singularities at  $k_x=0$  in  $P_{s11},\,P_{s12},\,P_{s21},\,P_{s31},\,P_{s31}$  are also removable. Thus, the overall equations have no singularity and will not meet numerical difficulty. In the solver, to short the code, if  $k_x\rho_s < k_\delta$  we set  $k_x\rho_s = k_\delta$  for magnetized species in EM version. For example, we can set  $k_\delta=10^{-30}$ .

Combining Eqs. (34) and (35), the equivalent linear system for electromagnetic dispersion relation can be obtained as

$$\begin{cases}
\omega v_{snjx} &= c_{snj}v_{snjx} + b_{snj11}E_x + b_{snj12}E_y + b_{snj13}E_z, \\
\omega j_x &= b_{11}E_x + b_{12}E_y + b_{13}E_z, \\
iJ_x \epsilon_0 &= j_x + \sum_{snj}v_{snjx}, \\
\omega v_{snjy} &= c_{snj}v_{snjy} + b_{snj21}E_x + b_{snj22}E_y + b_{snj23}E_z, \\
\omega j_y &= b_{21}E_x + b_{22}E_y + b_{23}E_z, \\
iJ_y/\epsilon_0 &= j_y + \sum_{snj}v_{snjy}, \\
\omega v_{snjz} &= c_{snj}v_{snjz} + b_{snj31}E_x + b_{snj32}E_y + b_{snj33}E_z, \\
\omega j_z &= b_{31}E_x + b_{32}E_y + b_{33}E_z, \\
iJ_z/\epsilon_0 &= j_z + \sum_{snj}v_{snjz}, \\
\omega E_x &= c^2k_zB_y - iJ_x/\epsilon_0, \\
\omega E_y &= -c^2k_zB_x + c^2k_xB_z - iJ_y/\epsilon_0, \\
\omega E_z &= -c^2k_zB_y - iJ_z/\epsilon_0, \\
\omega B_x &= -k_zE_y, \\
\omega B_y &= k_zE_x - k_xE_z, \\
\omega B_z &= k_xE_y,
\end{cases}$$
(38)

which yields a sparse matrix eigenvalue problem. The symbols such as  $v_{snjx}$ ,  $j_{x,y,z}$  and  $J_{x,y,z}$  used here do not have direct physical meanings but are analogy to the perturbed velocity and current density in the fluid derivations of plasma waves. The elements of the eigenvector  $(E_x, E_y, E_z, B_x, B_y, B_z)$  still represent the original perturbed electric and magnetic fields. Thus, the polarization of the solutions can also be obtained in a straightforward manner. The dimension of the matrix is  $N_N = 3 \times (N_{SNJ} + 1) + 6 = 3 \times \{[S \times (2 \times N + 1)] \times J + 1\} + 6$ , N is the harmonic numbers kept for magnetized species, J is the number of the order of J-pole expansion for Z function.

We can also separate the contribution from each species of  $\delta J = \sum_s \delta J_s = \sum_s \sigma_s \cdot \delta E$ . To do this, we use a

relation of  $\frac{b_{11}}{\omega} = \sum_{s} \frac{b_{11s}}{\omega}$ , and then we rewrite Eqs. (35) and (37) as

$$\begin{pmatrix} \delta J_{x} \\ \delta J_{y} \\ \delta J_{z} \end{pmatrix} = -i\epsilon_{0} \begin{pmatrix} \sum_{s} \frac{b_{s11}}{\omega} + \sum_{snj} \frac{b_{snj11}}{\omega - c_{snj}} & \sum_{s} \frac{b_{s12}}{\omega} + \sum_{snj} \frac{b_{snj12}}{\omega - c_{snj}} & \sum_{s} \frac{b_{s13}}{\omega} + \sum_{snj} \frac{b_{snj13}}{\omega - c_{snj}} \\ \sum_{s} \frac{b_{s21}}{\omega} + \sum_{snj} \frac{b_{snj21}}{\omega - c_{snj}} & \sum_{s} \frac{b_{s22}}{\omega} + \sum_{snj} \frac{b_{snj22}}{\omega - c_{snj}} & \sum_{s} \frac{b_{s23}}{\omega} + \sum_{snj} \frac{b_{snj23}}{\omega - c_{snj}} \\ \sum_{s} \frac{b_{s31}}{\omega} + \sum_{snj} \frac{b_{snj31}}{\omega - c_{snj}} & \sum_{s} \frac{b_{s32}}{\omega} + \sum_{snj} \frac{b_{snj32}}{\omega - c_{snj}} & \sum_{s} \frac{b_{snj33}}{\omega} + \sum_{snj} \frac{b_{snj33}}{\omega - c_{snj}} \end{pmatrix} \begin{pmatrix} \delta E_{x} \\ \delta E_{y} \\ \delta E_{z} \end{pmatrix}$$

$$= \sum_{s} \sigma_{s} \cdot \begin{pmatrix} \delta E_{x} \\ \delta E_{y} \\ \delta E_{z} \end{pmatrix}$$
(39)

with the coefficients

$$\begin{cases} b_{snj11} = \omega_{ps}^2 p_{11snj}/c_{snj}, \ b_{s11} = -\omega_{ps}^2 \left[ \sum_n \frac{2}{R_s} \frac{\omega_{es}^2}{k_L^2 L_{sx}^2} \sum_{l,m} a_{s,lm} \left\{ I_l \sum_n n^2 (2\Gamma_{an,m+1,0} - m\Gamma_{an,m-1,0}) \right\} + \sum_{nj} p_{11snj}/c_{snj} \right], \\ b_{snj12} = \omega_{ps}^2 p_{12snj}/c_{snj}, \ b_{s12} = -\omega_{ps}^2 \left[ \sum_{nj} p_{12snj}/c_{snj} \right], \\ b_{snj21} = \omega_{ps}^2 p_{21snj}/c_{snj}, \ b_{s21} = -\omega_{ps}^2 \left[ \sum_{nj} p_{21snj}/c_{snj} \right], \\ b_{snj22} = \omega_{ps}^2 p_{22snj}/c_{snj}, \ b_{s22} = -\omega_{ps}^2 \left[ \sum_{n} \frac{2}{R_s} \sum_{l,m} a_{s,lm} \left\{ I_l (2\Gamma_{cn,m+1,2} - m\Gamma_{cn,m-1,2}) \right\} + \sum_{nj} p_{22snj}/c_{snj} \right], \\ b_{snj31} = \omega_{ps}^2 p_{13snj}/c_{snj}, \ b_{s31} = -\omega_{ps}^2 \left[ \sum_{nj} p_{13snj}/c_{snj} \right], \\ b_{snj32} = \omega_{ps}^2 p_{23snj}/c_{snj}, \ b_{s23} = -\omega_{ps}^2 \left[ \sum_{nj} p_{23snj}/c_{snj} \right], \\ b_{snj32} = \omega_{ps}^2 p_{32snj}/c_{snj}, \ b_{s32} = -\omega_{ps}^2 \left[ \sum_{nj} p_{23snj}/c_{snj} \right], \\ b_{snj33} = \omega_{ps}^2 p_{33snj}/c_{snj}, \ b_{s33} = -\omega_{ps}^2 \left[ \sum_{nj} p_{32snj}/c_{snj} \right], \\ b_{snj33} = \omega_{ps}^2 p_{33snj}/c_{snj}, \ b_{s33} = -\omega_{ps}^2 \left[ \sum_{n} \frac{2}{R_s} \sum_{l,m} a_{s,lm} \left\{ \Gamma_{an,m,1} (2\frac{d_{sz}}{L_{sz}} I_{l+1} + 2I_{l+2} - l\frac{d_{sz}}{L_{sz}} I_{l-1} - lI_l) \right\} + \sum_{nj} p_{33snj}/c_{snj} \right], \\ c_{snj} = k_z v_{dsz} + n\omega_{cs} + k_z v_{zts} c_j. \end{cases}$$

Consequently, we have

$$\delta \mathbf{J}_{s} = \boldsymbol{\sigma}_{s} \cdot \delta \mathbf{E}, \quad \boldsymbol{\sigma}_{s} = -i\epsilon_{0} \begin{pmatrix} \frac{b_{s11}}{\omega} + \sum_{nj} \frac{b_{snj11}}{\omega - c_{snj}} & \frac{b_{s12}}{\omega} + \sum_{nj} \frac{b_{snj12}}{\omega - c_{snj}} & \frac{b_{s13}}{\omega} + \sum_{nj} \frac{b_{snj13}}{\omega - c_{snj}} \\ \frac{b_{s21}}{\omega} + \sum_{nj} \frac{b_{snj21}}{\omega - c_{snj}} & \frac{b_{s22}}{\omega} + \sum_{nj} \frac{b_{snj22}}{\omega - c_{snj}} & \frac{b_{s23}}{\omega} + \sum_{nj} \frac{b_{snj23}}{\omega - c_{snj}} \\ \frac{b_{s331}}{\omega} + \sum_{nj} \frac{b_{snj31}}{\omega - c_{snj}} & \frac{b_{s32}}{\omega} + \sum_{nj} \frac{b_{snj32}}{\omega - c_{snj}} & \frac{b_{snj32}}{\omega} \\ \end{pmatrix}.$$

$$(41)$$

We can use Eq. (41) to obtain  $\delta J_s$ . Since  $\delta E$  is known, the first approach requires solving the above 3-by-3 tensor for each species.

The second approach would be more convenient for obtaining  $\delta J_s$  based on the fact that a matrix eigenvalue method is used in BO/PDRK. For example, as given in Eq. (132) of Ref. [12], the perturbed current in x direction is

$$i\delta J_x \epsilon_0 = j_x + \sum_{snj} v_{snjx},\tag{42}$$

where  $j_x$  and  $v_{snjx}$  have been solved along with  $\delta E$  and  $\delta B$ .  $\delta J_{sx}$  can be directly obtained once  $j_x$  and  $v_{snjx}$  for each species s are known. Similarly, we can obtain  $\delta J_{sy}$  and  $\delta J_{sz}$ .

The quantities  $v_{snjx}$  are species quantities, but  $j_x$  was not in the original version of BO/PDRK. With the addition of only S-1 matrix elements, we can replace the matrix element  $j_x$  by a sum over S matrix elements  $j_{sx}$ , where S is the number of species. To do this, we modified the BO/PDRK matrix equations in Eq. (39), i.e.,

$$\begin{cases}
\omega j_{x} = b_{11} \delta E_{x} + b_{12} \delta E_{y} + b_{13} \delta E_{z}, \\
\omega j_{y} = b_{21} \delta E_{x} + b_{22} \delta E_{y} + b_{23} \delta E_{z}, \\
\omega j_{z} = b_{31} \delta E_{x} + b_{32} \delta E_{y} + b_{33} \delta E_{z},
\end{cases}$$
(43)

as

$$\begin{cases}
\omega j_{sx} = b_{s11} \delta E_x + b_{s12} \delta E_y + b_{s13} \delta E_z, \\
\omega j_{sy} = b_{s21} \delta E_x + b_{s22} \delta E_y + b_{s23} \delta E_z, \\
\omega j_{sz} = b_{s31} \delta E_x + b_{s32} \delta E_y + b_{s33} \delta E_z.
\end{cases}$$
(44)

This separation can directly give  $j_{sx,y,z}$  from the BO/PDRK matrix, which then yields  $\delta J_{sx,y,z}$  through the following equations

$$\begin{cases}
\delta J_{sx} = (j_{sx} + \sum_{nj} v_{snjx})/(i\epsilon_0), \\
\delta J_{sy} = (j_{sy} + \sum_{nj} v_{snjy})/(i\epsilon_0), \\
\delta J_{sz} = (j_{sz} + \sum_{nj} v_{snjz})/(i\epsilon_0).
\end{cases}$$
(45)

The updated matrix equations of BO, i.e., Eq.(132) of Ref.[12], become

$$\begin{cases}
\omega v_{snjx} &= c_{snj}v_{snjx} + b_{snj11}\delta E_x + b_{snj12}\delta E_y + b_{snj13}\delta E_z, \\
\omega j_{sx} &= b_{s11}\delta E_x + b_{s12}\delta E_y + b_{s13}\delta E_z, \\
i\delta J_x \epsilon_0 &= j_x + \sum_{snj}v_{snjx}, \\
\omega v_{snjy} &= c_{snj}v_{snjy} + b_{snj21}\delta E_x + b_{snj22}\delta E_y + b_{snj23}\delta E_z, \\
\omega j_{sy} &= b_{s21}\delta E_x + b_{s22}\delta E_y + b_{s23}\delta E_z, \\
i\delta J_y/\epsilon_0 &= j_y + \sum_{snj}v_{snjy}, \\
\omega v_{snjz} &= c_{snj}v_{snjz} + b_{snj31}\delta E_x + b_{snj32}\delta E_y + b_{snj33}\delta E_z, \\
\omega j_{sz} &= b_{s31}\delta E_x + b_{s32}\delta E_y + b_{s33}\delta E_z, \\
i\delta J_z/\epsilon_0 &= j_z + \sum_{snj}v_{snjz}, \\
\omega \delta E_x &= c^2k_z\delta B_y - i\delta J_x/\epsilon_0, \\
\omega \delta E_y &= -c^2k_z\delta B_x + c^2k_x\delta B_z - i\delta J_y/\epsilon_0, \\
\omega \delta E_z &= -c^2k_z\delta B_y - i\delta J_z/\epsilon_0, \\
\omega \delta B_x &= -k_z\delta E_y, \\
\omega \delta B_y &= k_z\delta E_x - k_x\delta E_z, \\
\omega \delta B_z &= k_x\delta E_y,
\end{cases}$$

$$(46)$$

which yields a sparse matrix eigenvalue problem  $\omega X = M(k) \cdot X$ . The symbols such as  $v_{snjx}$ ,  $j_{sx,y,z}$  and  $\delta J_{x,y,z}$  used here are analogous to the perturbed velocity and current density in fluid derivations of plasma waves. The elements of the eigenvector  $(\delta E_x, \delta E_y, \delta E_z, \delta B_x, \delta B_y, \delta B_z)$  represent the perturbed electric and magnetic fields. Thus, all variables of one plasma wave mode can be obtained in a straightforward manner. In addition, the dimension of the matrix is  $N_N = 3 \times (N_{SNJ} + S) + 6 = 3 \times \{[S \times (2 \times N + 1)] \times J + S\} + 6$ , N is the number of harmonics retained for magnetized species, and J is the order of the J-pole expansion used for calculation of the plasma dispersion Z function.

# 3 GPDF-Hermite Basis Function Expansion

As previously mentioned, while arbitrary bases can be used for the expansion, selecting an appropriate basis can significantly enhance performance.

## 3.1 Choose the basis function

We choose GPDF basis for parallel direction and Hermite basis for perpendicular direction in this section, with

$$f_{s0}(v_{\parallel}, v_{\perp}) = W_{sz}(v_{\parallel}) \sum_{l=-\infty}^{\infty} \sum_{m=0}^{\infty} a_{s0,lm} \rho_{sz,l}(v_{\parallel}) u_{sx,m}(v_{\perp}), \quad -\infty < v_{\parallel} < \infty, \quad 0 \le v_{\perp} < \infty, \tag{47}$$

where  $\rho_{sz,l}$  and  $u_{sx,m}$  are basis functions for parallel and perpendicular directions, with  $W_{sz}$  be corresponding weight functions, which satisfy

$$\int_{-\infty}^{\infty} W_{sz}(v) \rho_{sz,n}(v) \rho_{sz,n'}^{*}(v) dv = A_{sz} \delta_{n,n'}, \quad \int_{-\infty}^{\infty} u_{sx,n}(v) u_{sx,n'}^{*}(v) dv = A_{sx} \delta_{n,n'}. \tag{48}$$

Here, the asterisk denotes complex conjugation and  $\delta_{n,n'}$  is the Kronechker delta. The weight  $W_{sx} = 1$  are omitted in the above form. Thus, we have

$$a_{s0,lm} = \frac{1}{A_{sx}A_{sz}} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f_{s0}(v_{\parallel}, v_{\perp}) \rho_{sz,l}^{*}((v_{\parallel}) u_{sx,m}^{*}(v_{\perp}) dv_{\parallel} dv_{\perp}.$$
 (49)

We choose GPDF basis [11, 1] for  $v_{\parallel}$  direction

$$\rho_{sz,n}(z) = \frac{(L_{sz} + iz)^n}{(L_{sz} - iz)^n}, \quad W_{sz}(z) = \frac{L_{sz}^2}{L_{sz}^2 + z^2}, \quad -\infty < z < \infty, \tag{50}$$

with corresponding velocity widths be  $L_{sz}$ . Use

$$e^{i\phi} = \frac{(L_{sz} + iz)}{(L_{sz} - iz)}, \quad z = L_{sz} \cdot \tan\left(\frac{\phi}{2}\right), \quad \frac{dz}{d\phi} = \frac{L_{sz}^2 + z^2}{2L_{sz}},\tag{51}$$

and

$$\int_{-\pi}^{\pi} e^{in\phi} e^{-im\phi} d\phi = 2\pi \delta_{m,n},\tag{52}$$

it is readily to show that  $A_{sz}=\pi L_{sz}$ . Since the above basis function is relevant to Fourier basis, which would be convergent exponentially and  $a_{s,lm}$  can be calculated fastly by fast Fourier transformation (FFT). Another benefit is that the parallel velocity integral Z function can be calculated analytically, thus be also fast and accurate. In practical test, we find the truncation  $l=-M,-(M-1),\cdots,-1,0,1,\cdots,(M-1),M$  are usually sufficiently accurate for  $M\leq 16$ . Due to the even symmetry of  $f_{s0}(v_{\perp})$ , we have  $a_{s0,lm}=0$  for odd  $m=1,3,5,\cdots$ .

The basis function for perpendicular  $v_{\perp}$  direction is choosen as

$$u_{sx,n}(x) = h_n \left( \frac{\sqrt{2}(x - d_{sx})}{L_{sx}} \right), \quad -\infty < x < \infty, \tag{53}$$

with corresponding velocity widths be  $L_{sx}$ . Note that we have extend  $0 \le v_{\perp} < \infty$  to  $-\infty < v_{\perp} < \infty$ , with  $f_{s0}(v_{\parallel}, v_{\perp}) = f_{s0}(v_{\parallel}, -v_{\perp})$ . Here  $h_n$  is Hermite function

$$h_n(y) = \sqrt{\frac{1}{2^n n! \sqrt{\pi}}} H_n(y) e^{-y^2/2}, \quad \int_{-\infty}^{\infty} h_n(y) h_{n'}(y) dy = \delta_{nn'}, \tag{54}$$

$$H_0(y) = 1$$
,  $H_1(y) = 2y$ ,  $H_2(y) = 4y^2 - 2$ ,  $H_3(y) = 8y^3 - 12y$ ,  $\cdots$  (55)

$$H'_n(y) = 2nH_{n-1}(y), \quad H_n(-y) = (-1)^n H_n(y), \quad H_{n+1}(y) = 2yH_n(y) - 2nH_{n-1}(y).$$
 (56)

We have  $A_{sx} = L_{sx}/\sqrt{2}$ .

For later more convenient of calculations, we can rewrite the above expansion to the follow form

$$f_{s0}(v_{\parallel}, v_{\perp}) = W_{sz}(v_{\parallel}) \sum_{l=-\infty}^{\infty} \sum_{m=0}^{\infty} a_{s0,lm} \rho_{sz,l}(v_{\parallel}) u_{sx,m}(v_{\perp}) = c_{s0} W_{sz}(v_{\parallel}) \sum_{l=-\infty}^{\infty} \sum_{m=0}^{\infty} a_{s,lm} \cdot \rho_{sz,l}(v_{\parallel}) \cdot g_{sx,m}(v_{\perp}), \quad (57)$$

with

$$g_{sx,m}(v_{\perp}) = \left(\frac{v_{\perp} - d_{sx}}{L_{sx}}\right)^m e^{-\left(\frac{v_{\perp} - d_{sx}}{L_{sx}}\right)^2},\tag{58}$$

and normalized coefficient

$$c_{s0} = \frac{1}{\pi^2 L_{sz} L_{sx}^2 R_s}, \quad R_s = \exp\left(-\frac{d_{sx}^2}{L_{sx}^2}\right) + \frac{\sqrt{\pi} d_{sx}}{L_{sx}} \operatorname{erfc}\left(-\frac{d_{sx}}{L_{sx}}\right),$$
 (59)

and  $\operatorname{erfc}(-x) = 1 - \operatorname{erf}(-x) = 1 + \operatorname{erf}(x)$  is the complementary error function. After obtaining the coefficients  $a_{s0,lm}$ , it is readily to calculate the coefficients  $a_{s,lm}$ . Note that this new  $g_{sx,m}$  is not orthogonal.

# 3.2 Calculate the dispersion relation

We define

$$f_{s0,lm}(v_{\parallel}, v_{\perp}) \equiv a_{s,lm} W_{sz}(v_{\parallel}) \rho_{sz,l}(v_{\parallel}) u_{sx,m}(v_{\perp}) = a_{s,lm} f_{s0z,l}(v_{\parallel}) f_{s0x,m}(v_{\perp}), \tag{60}$$

$$f_{s0}(v_{\parallel}, v_{\perp}) = c_{s0} \sum_{l=-\infty}^{\infty} \sum_{m=0}^{\infty} f_{s0,lm}(v_{\parallel}, v_{\perp}), \quad f_{s0z,l}(v_{\parallel}) \equiv W_{sz}(v_{\parallel}) \rho_{sz,l}(v_{\parallel}), \quad f_{s0x,m}(v_{\perp}) \equiv u_{sx,m}(v_{\perp}). \tag{61}$$

Hence, we have

$$\frac{\partial f_{s0,lm}}{\partial v_{\parallel}} = a_{s,lm} f_{s0x,m}(v_{\perp}) \frac{\partial f_{s0z,l}(v_{\parallel})}{\partial v_{\parallel}}, \quad \frac{\partial f_{s0,lm}}{\partial v_{\perp}} = a_{s,lm} f_{s0z,l}(v_{\parallel}) \frac{\partial f_{s0x,m}(v_{\perp})}{\partial v_{\perp}}, \tag{62}$$

$$\frac{\partial f_{s0z,l}(v_{\parallel})}{\partial v_{\parallel}} = \frac{\partial}{\partial v_{\parallel}} \left[ \frac{(L_{sz} + iv_{\parallel})^{l}}{(L_{sz} - iv_{\parallel})^{l}} \frac{L_{sz}^{2}}{L_{sz}^{2} + v_{\parallel}^{2}} \right] = \frac{i}{2L_{sz}} [(l-1)f_{s0z,l-1} + 2lf_{s0z,l} + (l+1)f_{s0z,l+1}], \tag{63}$$

$$\frac{\partial f_{s0x,m}(v_{\perp})}{\partial v_{\perp}} = \frac{1}{L_{sx}} \left[ m f_{s0x,m-1} - 2 f_{s0x,m+1} \right]. \tag{64}$$

Here, we set  $f_{s0x,m}=0$  for all m<0. The above derivatives equations are valid for all  $l=0,\pm 1,\pm 2,\cdots$  and  $m=0,1,2,\cdots$ . We have also numerically checked the valid of the above two derivatives.

For parallel integral  $[\operatorname{Im}(\zeta_{sn}) > 0]$ , define

$$Z_{l,p}(\zeta_{sn}) \equiv \frac{k_{\parallel}}{L_{sz}^p \pi} \int_{-\infty}^{\infty} \frac{v_{\parallel}^p f_{s0z,l}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} dv_{\parallel} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{g_{l,p}(z)}{\zeta_{sn} - z} dz, \tag{65}$$

$$g_{l,p}(z) \equiv \frac{(1+iz)^l}{(1-iz)^l} \frac{z^p}{1+z^2},\tag{66}$$

we have [1]

$$Z_{l,0} = \begin{cases} -\frac{i}{(1-i\zeta_{sn})}, & l = 0, \\ -\frac{2i}{1+\zeta_{sn}^2} \frac{(1+i\zeta_{sn})^l}{(1-i\zeta_{sn})^l}, & l > 0, \\ 0, & l < 0, \end{cases}$$
(67)

$$Z_{l,1} = \zeta_{sn} Z_{l,0} - \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{(1+iz)^l}{(1-iz)^l} \frac{1}{1+z^2} dz = \zeta_{sn} Z_{l,0} - \delta_{l,0}, \tag{68}$$

$$Z_{l,2} = \zeta_{sn} Z_{l,1} - \frac{1}{\pi} \int_{-\infty}^{\infty} z \frac{(1+iz)^l}{(1-iz)^l} \frac{1}{1+z^2} dz = \zeta_{sn} Z_{l,1} + \operatorname{sgn}(l) \cdot (-1)^l \cdot i, \tag{69}$$

with  $\zeta_{sn} = \frac{\omega - n\omega_{cs}}{k_{\parallel}L_{sz}}$ , p = 0, 1, 2. And we redefine  $Z_{l,0} \equiv Z_l$  for simplify the notation. We have also numerically checked the valid of the above  $Z_{l,p}$  equations for different l. Note also that the final right hand side form is also valid for weak damped  $\text{Im}(\zeta_{sn}) \simeq 0$  mode, since which is naturally analytic continuous for both  $\text{Im}(\zeta_{sn}) > 0$  and  $\operatorname{Im}(\zeta_{sn}) \leq 0$ . They may be not valid for strong damped mode, which is due to that the analytic form of the  $f_{0s}$  is not exactly as the one give by the expansion form. In this work, we hope to solve all the solutions of the dispersion relations, hence we mainly use the above rational form of  $Z_{l,p}$ . It is shown[17] that the rational form is sufficient for weak damped mode, say  $\text{Im}(\zeta) > -2$ . Note also that  $I_{l,0} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{(1+iz)^l}{(1-iz)^l} \frac{1}{1+z^2} dz = \delta_{l,0}$  due to the orthogonal, and  $I_{l,1} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{(1+iz)^l}{(1-iz)^l} \frac{z}{1+z^2} dz$ .

For perpendicular integral

$$\Gamma_{an,m,p}(a_s,d_s) \equiv \frac{1}{L_{sx}^{p+1}} \int_0^\infty v_\perp^p J_n^2 (\frac{k_\perp v_\perp}{\omega_{cs}}) (\frac{v_\perp - d_{sx}}{L_{sx}})^m e^{-(\frac{v_\perp - d_{sx}}{L_{sx}})^2} dv_\perp = \int_0^\infty x^p J_n^2 (a_s x) (x - d_s)^m e^{-(x - d_s)^2} dx,$$

$$\Gamma_{bn,m,p}(a_s,d_s) \equiv \frac{1}{L_{sx}^{p+1}} \int_0^\infty v_\perp^p J_n (\frac{k_\perp v_\perp}{\omega_{cs}}) J_n' (\frac{k_\perp v_\perp}{\omega_{cs}}) (\frac{v_\perp - d_{sx}}{L_{sx}})^m e^{-(\frac{v_\perp - d_{sx}}{L_{sx}})^2} dv_\perp = \int_0^\infty x^p J_n (a_s x) J_n' (a_s x) (x - d_s)^m e^{-(x - d_s)^2} dx,$$

$$\Gamma_{cn,m,p}(a_s,d_s) \equiv \frac{1}{L_{sx}^{p+1}} \int_0^\infty v_\perp^p J_n'^2 (\frac{k_\perp v_\perp}{\omega_{cs}}) (\frac{v_\perp - d_{sx}}{L_{sx}})^m e^{-(\frac{v_\perp - d_{sx}}{L_{sx}})^2} dv_\perp = \int_0^\infty x^p J_n'^2 (a_s x) (x - d_s)^m e^{-(x - d_s)^2} dx,$$

with  $a_s=k_\perp\rho_{cs},\,d_s=d_{sx}/L_{sx},\,\rho_{cs}=L_{sx}/\omega_{cs},\,p=0,1,2,3.$  These integrals can be calculated numerically[12]. For  $d_{sx}=0$ , they are relavant to the modified Bessel functions of the first kind as in the Maxwellian case. Note that we have the normalized condition:  $1=\int_{-\infty}^{\infty}\int_{0}^{\infty}2\pi v_\perp f_{s0}dv_\perp dv_\parallel$ .

Hence, we have

$$A_{s} = c_{s0} \sum_{l} \sum_{m} a_{s,lm} \left\{ \frac{\omega - k_{\parallel} v_{\parallel}}{\omega} f_{s0z,l} \frac{1}{L_{sx}} [m f_{s0x,m-1} - 2 f_{s0x,m+1}] + \frac{k_{\parallel} v_{\perp}}{\omega} f_{s0x,m} \frac{i}{2L_{sz}} [(l-1) f_{s0z,l-1} + 2 l f_{s0z,l} + (l+1) f_{s0z,l+1}] \right\},$$

$$B_{s} = c_{s0} \sum_{l} \sum_{m} a_{s,lm} \left\{ \frac{n \omega_{cs} v_{\parallel}}{\omega v_{\perp}} f_{s0z,l} \frac{1}{L_{sx}} [m f_{s0x,m-1} - 2 f_{s0x,m+1}] + \frac{\omega - n \omega_{cs}}{\omega} f_{s0x,m} \frac{i}{2L_{sx}} [(l-1) f_{s0z,l-1} + 2 l f_{s0z,l} + (l+1) f_{s0z,l+1}] \right\}.$$

$$(73)$$

Define

$$\boldsymbol{X}_{sn} = \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel}v_{\parallel} - n\omega_{cs}} \times \begin{bmatrix} A_{s} \frac{n^{2}v_{\perp}}{\mu_{s}^{2}} J_{n}^{2} & iA_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n} J_{n}^{\prime} & B_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n}^{2} \\ -iA_{s} \frac{nv_{\perp}}{\mu_{s}^{2}} J_{n} J_{n}^{\prime} & A_{s}v_{\perp} J_{n}^{\prime} J_{n}^{\prime} & -iB_{s}v_{\perp} J_{n} J_{n}^{\prime} \\ A_{s} \frac{nv_{\parallel}}{\mu_{s}^{2}} J_{n}^{2} & iA_{s}v_{\parallel} J_{n} J_{n}^{\prime} & B_{s}v_{\parallel} J_{n}^{2} \end{bmatrix}.$$
 (75)

We have

$$\begin{split} X_{sn11} &= \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel}v_{\parallel} - n\omega_{cs}} \times A_{s} \frac{n^{2}v_{\perp}}{\mu_{s}^{2}} J_{n}^{2} = \frac{n^{2}\omega_{cs}^{2}}{k_{\perp}^{2}} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel}v_{\parallel} - n\omega_{cs}} \times A_{s} J_{n}^{2} \\ &= c_{s0} \frac{n^{2}\omega_{cs}^{2}}{k_{\perp}^{2}} \sum_{l} \sum_{m} a_{s,lm} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{\pi\omega dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel}v_{\parallel} - n\omega_{cs}} \times \left\{ \frac{\omega - k_{\parallel}v_{\parallel}}{\omega} f_{s0z,l} \frac{2}{L_{sx}} [mf_{s0x,m-1} - 2f_{s0x,m+1}] \right. \\ &+ \frac{k_{\parallel}v_{\perp}}{\omega} f_{s0x,m} \frac{i}{L_{sz}} [(l-1)f_{s0z,l-1} + 2lf_{s0z,l} + (l+1)f_{s0z,l+1}] \right\} J_{n}^{2} \\ &= \frac{1}{\pi L_{sz} L_{sx}^{2} R_{s}} \frac{n^{2}\omega_{cs}^{2}}{k_{\perp}^{2}} \sum_{l} \sum_{m} a_{s,lm} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel}v_{\parallel} - n\omega_{cs}} \times \left\{ (\omega - k_{\parallel}v_{\parallel})f_{s0z,l} \frac{2}{L_{sx}} [mf_{s0x,m-1} - 2f_{s0x,m+1}] \right. \\ &+ k_{\parallel}v_{\perp}f_{s0x,m} \frac{i}{L_{sz}} [(l-1)f_{s0z,l-1} + 2lf_{s0z,l} + (l+1)f_{s0z,l+1}] \right\} J_{n}^{2} \\ &= \frac{1}{R_{s}} \frac{n^{2}\omega_{cs}^{2}}{k_{\perp}^{2} L_{sx}^{2}} \sum_{l} \sum_{m} a_{s,lm} \left\{ \left( \frac{n\omega_{cs}}{k_{\parallel}L_{sz}} Z_{l,0} + I_{l,0} \right) (2m\Gamma_{an,m-1,0} - 4\Gamma_{an,m+1,0}) \right. \\ &+ \Gamma_{an,m,1} \frac{iL_{sx}^{2}}{L_{cx}^{2}} [(l-1)Z_{l-1,0} + 2lZ_{l,0} + (l+1)Z_{l+1,0}] \right\}, \end{split}$$

$$\begin{split} X_{sn12} &= -X_{sn21} = \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times iA_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n} J_{n}' = i \frac{n\omega_{cs}}{k_{\perp}} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times A_{s} J_{n} J_{n}' \\ &= i \frac{1}{R_{s}} \frac{n\omega_{cs}}{k_{\perp} L_{sx}} \sum_{l} \sum_{m} a_{s,lm} \Big\{ (\frac{n\omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,0} + I_{l,0}) (2m\Gamma_{bn,m-1,1} - 4\Gamma_{2n,m+1,1}) \\ &+ \Gamma_{bn,m,2} \frac{iL_{sx}^{2}}{L_{sz}^{2}} [(l-1)Z_{l-1,0} + 2lZ_{l,0} + (l+1)Z_{l+1,0}] \Big\} \\ &\rightarrow i \frac{1}{R_{s}} \frac{n\omega_{cs}}{k_{\perp} L_{sx}} \sum_{l} \sum_{m} a_{s,lm} \Big\{ \frac{n\omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,0} (2m\Gamma_{bn,m-1,1} - 4\Gamma_{2n,m+1,1}) \\ &+ \Gamma_{bn,m,2} \frac{iL_{sx}^{2}}{L_{sz}^{2}} [(l-1)Z_{l-1,0} + 2lZ_{l,0} + (l+1)Z_{l+1,0}] \Big\}, \end{split}$$

$$\begin{split} X_{sn31} &= X_{sn13} = \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times A_{s} \frac{nv_{\parallel}}{\mu_{s}} J_{n}^{2} = \frac{n\omega_{cs}}{k_{\perp}} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times A_{s} J_{n}^{2} \\ &= c_{s0} \frac{n\omega_{cs}}{k_{\perp}} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \sum_{l} \sum_{n} a_{s,lm} \left\{ \frac{\omega - k_{\parallel} v_{\parallel}}{\omega - k_{\parallel} v_{\parallel}} \int_{soz,m-1}^{soz,l-1} - 2f_{s0z,m-1} - 2f_{s0z,m-1} \right\} \\ &= \frac{k_{\parallel} v_{\perp}}{\omega} f_{s0z,m} \frac{i}{2L_{sz}} [(l-1)f_{s0z,l-1} + 2lf_{s0z,l} + (l+1)f_{s0z,l+1}] J_{n}^{2} \\ &= \frac{1}{\pi L_{sz} L_{sz}^{2} R_{s}} \frac{n\omega_{cs}}{k_{\perp}} \sum_{n} \sum_{\infty} a_{s,lm} \left\{ \frac{m\omega_{cs}}{k_{\parallel} L_{sz}} \sum_{l} \sum_{l} a_{s,lm} \left\{ \frac{\omega - k_{\parallel} v_{\parallel}}{\omega - k_{\parallel} v_{\parallel}} \right\} J_{n}^{2} \right\} \\ &= \frac{1}{\pi L_{sz} L_{sz}^{2} R_{s}} \sum_{k} \sum_{l} \sum_{n} a_{s,lm} \left\{ \frac{m\omega_{cs}}{k_{\parallel} L_{sz}} \sum_{l} \sum_{l} \sum_{n} a_{s,lm} \left\{ \frac{\omega - k_{\parallel} v_{\parallel}}{\omega - k_{\parallel} v_{\parallel}} \right\} J_{n}^{2} \right\} \\ &= \frac{1}{L_{sz}} \frac{n\omega_{cs}}{k_{\perp} L_{sz}} \sum_{l} \sum_{n} a_{s,lm} \left\{ \frac{m\omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,1} \left\{ l + 1 \right\} J_{s0z,l+1} \right\} J_{n}^{2} \\ &= \frac{1}{L_{sz}} \frac{n\omega_{cs}}{k_{\parallel} L_{sz}} \left[ (l-1)Z_{l-1,1} + 2lZ_{l,1} + (l+1)Z_{l+1,1} \right] \\ &\rightarrow \frac{1}{R_{s}} \frac{n\omega_{cs}}{k_{\perp} L_{sz}} \sum_{l} \sum_{n} a_{s,lm} \left\{ \frac{m\omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,1} \left\{ 2m\Gamma_{an,m-1,0} - 4\Gamma_{an,m+1,0} \right\} \right. \\ &+ \Gamma_{an,m,1} \frac{1L_{az}}{L_{sz}} \left[ (l-1)Z_{l-1,1} + 2lZ_{l,1} + (l+1)Z_{l+1,1} \right] \right\} , \\ X_{sn32} &= -X_{sn23} = \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times iA_{s} v_{\parallel} J_{n} J_{n}^{r} = i \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times iA_{s} J_{n} J_{n}^{r} \\ &= i \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times iA_{s} J_{n} J_{n}^{r} = i \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times iA_{s} J_{n} J_{n}^{r} \\ &= i \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} v_{\parallel} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \sum_{n} \sum_{n} a_{s} J_{n} \left\{ \frac{\omega v_{\parallel} v_{\parallel} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \sum_{n} \sum_$$

and

$$\begin{split} X_{sn33} &= \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n \omega_{cs}} \times B_{s} v_{\parallel} J_{n}^{2} = \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n \omega_{cs}} \times B_{s} J_{n}^{2} \\ &= \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n \omega_{cs}} c_{s0} \sum_{l} \sum_{m} a_{s,lm} \left\{ \frac{n \omega_{cs} v_{\parallel}}{\omega v_{\perp}} f_{s0z,l} \frac{1}{L_{sx}} [m f_{s0x,m-1} - 2 f_{s0x,m+1}] \right. \\ &\quad + \frac{\omega - n \omega_{cs}}{\omega} f_{s0x,m} \frac{i}{2L_{sz}} [(l-1) f_{s0z,l-1} + 2 l f_{s0z,l} + (l+1) f_{s0z,l+1}] \right\} J_{n}^{2} \\ &= \frac{1}{\pi L_{sz} L_{sx}^{2} R_{s}} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n \omega_{cs}} \sum_{l} \sum_{m} a_{s,lm} \left\{ n \omega_{cs} v_{\parallel}^{2} f_{s0z,l} \frac{1}{L_{sx}} [2m f_{s0x,m-1} - 4 f_{s0x,m+1}] \right. \\ &\quad + v_{\parallel} v_{\perp} (\omega - n \omega_{cs}) f_{s0x,m} \frac{i}{L_{sz}} [(l-1) f_{s0z,l-1} + 2 l f_{s0z,l} + (l+1) f_{s0z,l+1}] \right\} J_{n}^{2} \\ &= \frac{L_{sz}^{2}}{L_{sx}^{2} R_{s}} \sum_{l} \sum_{m} a_{s,lm} \left\{ \frac{n \omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,2} (2m \Gamma_{an,m-1,0} - 4 \Gamma_{1n,m+1,0}) \right. \\ &\quad + \Gamma_{an,m,1} i \frac{L_{sx}^{2}}{L_{sz}^{2}} [(l-1) Z_{l-1,2} + 2 l Z_{l,2} + (l+1) Z_{l+1,2} + (l-1) I_{l-1,1} + 2 l I_{l,1} + (l+1) I_{l+1,1}] \right\} \\ &= \frac{L_{sz}^{2}}{L_{sx}^{2} R_{s}} \sum_{l} \sum_{m} a_{s,lm} \left\{ \frac{n \omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,2} (2m \Gamma_{an,m-1,0} - 4 \Gamma_{1n,m+1,0}) \right. \\ &\quad + \Gamma_{an,m,1} i \frac{L_{sx}^{2}}{L_{sz}^{2}} [(l-1) Z_{l-1,2} + 2 l Z_{l,2} + (l+1) Z_{l+1,2} + 2 i \delta_{l,0}] \right\}, \end{split}$$

where

$$Q = \sum_{s} Q_{s}, \quad Q_{s} = \frac{\omega_{ps}^{2}}{\omega^{2}} P_{s}, \quad P_{s} = \sum_{n} P_{sn}, \quad P_{sn} = c_{s0} X_{sn}.$$
 (76)

We have used  $(l-1)I_{l-1,1} + 2lI_{l,1} + (l+1)I_{l+1,1} = 2i\delta_{l,0}$ . Here, ' $\rightarrow$ ' means the constant terms  $I_l$  has been summation out for n. We have used  $\sum_{n=-\infty}^{\infty} J_n J'_n = 0$ ,  $\sum_{n=-\infty}^{\infty} n J_n^2 = 0, \sum_{n=-\infty}^{\infty} n J_n J_n' = 0, \sum_{n=-\infty}^{\infty} J_n^2 = 1, \sum_{n=-\infty}^{\infty} (J_n')^2 = \frac{1}{2} \text{ and } \sum_{n=-\infty}^{\infty} \frac{n^2 J_n^2}{x^2} = \frac{1}{2}.$ After the above expansion, the dispersion relation Eq.(1) can be readily solved use conventional iterative root

finding method. Since the perpendicular integral  $\Gamma(a_s)$  need only calculate once, and the parallel integrals  $Z(\zeta_{sn})$ are finite rational form, this approach can obtain high accurate solution with less computation cost. The above dispersion relation can also be transformed to matrix method similar to the  $\kappa$  distribution case [14, 13]. We omit the transformation here since it is slightly complicated.

#### GPDF-GPDF Basis Function Expansion 4

As previously mentioned, while arbitrary bases can be used for the expansion, selecting an appropriate basis can significantly enhance performance.

#### 4.1 Choose the basis function

We choose GPDF basis for parallel direction and modified GPDF basis for perpendicular direction in this section,

$$f_{s0}(v_{\parallel}, v_{\perp}) = W_{sz}(v_{\parallel})W_{sx}^{2}(v_{\perp}) \sum_{l=-\infty}^{\infty} \sum_{m=-\infty}^{\infty} a_{s0,lm} \rho_{sz,l}(v_{\parallel}) u_{sx,m}(v_{\perp}), \quad -\infty < v_{\parallel} < \infty, \quad 0 \le v_{\perp} < \infty, \quad (77)$$

where  $\rho_{sz,l}$  and  $u_{sx,m}$  are basis functions for parallel and perpendicular directions, with  $W_{sz}$  and  $W_{sx}$  be corre-

$$\int_{-\infty}^{\infty} W_{sz}(v) \rho_{sz,n}(v) \rho_{sz,n'}^{*}(v) dv = A_{sz} \delta_{n,n'}, \quad \int_{-\infty}^{\infty} W_{sx}(v) u_{sx,n}(v) u_{sx,n'}^{*}(v) dv = A_{sx} \delta_{n,n'}.$$
 (78)

Here, the asterisk denotes complex conjugation and  $\delta_{n,n'}$  is the Kronechker delta. Note for perpendicular direction, we use  $W_{sx}^2(v_{\perp})$  instead of  $W_{sx}(v_{\perp})$  is to avoid the divergence of later perpendicular integral. Thus, we have

$$a_{s0,lm} = \frac{1}{A_{sx}A_{sz}} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \frac{f_{s0}(v_{\parallel}, v_{\perp})}{W_{sx}(v_{\perp})} \rho_{sz,l}^{*}((v_{\parallel})u_{sx,m}^{*}(v_{\perp})dv_{\parallel}dv_{\perp}.$$
 (79)

We choose both GPDF basis [11, 1] for  $v_{\parallel}$  and  $v_{\perp}$  direction

$$\rho_{sz,n}(z) = \frac{(L_{sz} + iz)^n}{(L_{sz} - iz)^n}, \quad W_{sz}(z) = \frac{L_{sz}^2}{L_{sz}^2 + z^2}, \quad -\infty < z < \infty, \tag{80}$$

$$u_{sx,n}(x) = \frac{(L_{sx} + ix)^n}{(L_{sx} - ix)^n}, \quad W_{sx}(x) = \frac{L_{sx}^2}{L_{sx}^2 + x^2}, \quad 0 < x < \infty,$$
(81)

with corresponding velocity widths be  $L_{sz}$  and  $L_{sx}$ . Use

$$e^{i\phi} = \frac{(L+iz)}{(L-iz)}, \quad z = L \cdot \tan\left(\frac{\phi}{2}\right), \quad \frac{dz}{d\phi} = \frac{L^2 + z^2}{2L},$$
 (82)

and

$$\int_{-\pi}^{\pi} e^{in\phi} e^{-im\phi} d\phi = 2\pi \delta_{m,n},\tag{83}$$

it is readily to show that  $A_{sz}=\pi L_{sz}$  and  $A_{sx}=\pi L_{sx}$ . Since the above basis function is relevant to Fourier basis, which would be convergent exponentially and  $a_{s,lm}$  can be calculated fastly by fast Fourier transformation (FFT). Another benefit is that the parallel velocity integral Z function can be calculated analytically, thus be also fast and accurate. In practical test, we find the truncation  $l=-M,-(M-1),\cdots,-1,0,1,\cdots,(M-1),M$  are usually sufficiently accurate for  $M\leq 16$ . Note that we have extend  $0\leq v_{\perp}<\infty$  to  $-\infty< v_{\perp}<\infty$ , with  $f_{s0}(v_{\parallel},v_{\perp})=f_{s0}(v_{\parallel},-v_{\perp})$ . Due to the even symmetry of  $f_{s0}(v_{\perp})$ , we have  $a_{s,l,m}=a_{s,l,-m}$ . The benifit of GPDF-GPDF expansion is that the coefficients can be calculate fastly use FFT.

For later more convenient of calculations, we can rewrite the above expansion to the follow form

$$f_{s0}(v_{\parallel}, v_{\perp}) = W_{sz}(v_{\parallel})W_{sx}^{2}(v_{\perp}) \sum_{l=-\infty}^{\infty} \sum_{m=-\infty}^{\infty} a_{s0,lm} \rho_{sz,l}(v_{\parallel}) u_{sx,m}(v_{\perp})$$

$$= c_{s0}W_{sz}(v_{\parallel})W_{sx}^{2}(v_{\perp}) \sum_{l=-\infty}^{\infty} \sum_{m=-\infty}^{\infty} a_{s,lm} \cdot \rho_{sz,l}(v_{\parallel}) \cdot u_{sx,m}(v_{\perp}), \tag{84}$$

with the normalized coefficient

$$c_{s0} = \frac{1}{\pi^2 L_{sz} L_{cx}^2}. (85)$$

After obtaining the coefficients  $a_{s0,lm}$ , it is readily to calculate the coefficients  $a_{s,lm}$ .

# 4.2 Calculate the dispersion relation

We define

$$f_{s0,lm}(v_{\parallel},v_{\perp}) \equiv a_{s,lm} W_{sz}(v_{\parallel}) W_{sx}^{2}(v_{\perp}) \rho_{sz,l}(v_{\parallel}) u_{sx,m}(v_{\perp}) = a_{s,lm} f_{s0z,l}(v_{\parallel}) f_{s0x,m}(v_{\perp}),$$
(86)

$$f_{s0}(v_{\parallel}, v_{\perp}) = c_{s0} \sum_{l=-\infty}^{\infty} \sum_{m=-\infty}^{\infty} f_{s0,lm}(v_{\parallel}, v_{\perp}), \quad f_{s0z,l}(v_{\parallel}) \equiv W_{sz}(v_{\parallel}) \rho_{sz,l}(v_{\parallel}), \quad f_{s0x,m}(v_{\perp}) \equiv W_{sx}^{2}(v_{\perp}) u_{sx,m}(v_{\perp}).$$
(87)

Hence, we have

$$\frac{\partial f_{s0,lm}}{\partial v_{\parallel}} = a_{s,lm} f_{s0x,m}(v_{\perp}) \frac{\partial f_{s0z,l}(v_{\parallel})}{\partial v_{\parallel}}, \quad \frac{\partial f_{s0,lm}}{\partial v_{\perp}} = a_{s,lm} f_{s0z,l}(v_{\parallel}) \frac{\partial f_{s0x,m}(v_{\perp})}{\partial v_{\perp}}, \quad (88)$$

$$\frac{\partial f_{s0z,l}(v_{\parallel})}{\partial v_{\parallel}} = \frac{\partial}{\partial v_{\parallel}} \left[ \frac{(L_{sz} + iv_{\parallel})^{l}}{(L_{sz} - iv_{\parallel})^{l}} \frac{L_{sz}^{2}}{L_{sz}^{2} + v_{\parallel}^{2}} \right] = \frac{i}{2L_{sz}} [(l-1)f_{s0z,l-1} + 2lf_{s0z,l} + (l+1)f_{s0z,l+1}], \quad (89)$$

$$\frac{\partial f_{s0x,m}(v_{\perp})}{\partial v_{\perp}} = \frac{\partial}{\partial v_{\perp}} \left[ \frac{(L_{sx} + iv_{\perp})^m}{(L_{sx} - iv_{\perp})^m} \left( \frac{L_{sx}^2}{L_{sx}^2 + v_{\perp}^2} \right)^2 \right] = \frac{i}{2L_{sx}} \left[ (m-2)f_{s0x,m-1} + 2mf_{s0x,m} + (m+2)f_{s0x,m+1} \right]. \tag{90}$$

The above derivatives equations are valid for all  $l, m = 0, \pm 1, \pm 2, \cdots$ . We have also numerically checked the valid of the above two derivatives.

For parallel integral  $[\operatorname{Im}(\zeta_{sn}) > 0]$ , define

$$Z_{l,p}(\zeta_{sn}) \equiv \frac{k_{\parallel}}{L_{sz}^p \pi} \int_{-\infty}^{\infty} \frac{v_{\parallel}^p f_{s0z,l}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} dv_{\parallel} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{g_{l,p}(z)}{\zeta_{sn} - z} dz, \tag{91}$$

$$g_{l,p}(z) \equiv \frac{(1+iz)^l}{(1-iz)^l} \frac{z^p}{1+z^2},\tag{92}$$

we have[1]

$$Z_{l,0} = \begin{cases} -\frac{i}{(1-i\zeta_{sn})}, & l = 0, \\ -\frac{2i}{1+\zeta_{sn}^2} \frac{(1+i\zeta_{sn})^l}{(1-i\zeta_{sn})^l}, & l > 0, \\ 0, & l < 0, \end{cases}$$
(93)

$$Z_{l,1} = \zeta_{sn} Z_{l,0} - \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{(1+iz)^l}{(1-iz)^l} \frac{1}{1+z^2} dz = \zeta_{sn} Z_{l,0} - \delta_{l,0}, \tag{94}$$

$$Z_{l,2} = \zeta_{sn} Z_{l,1} - \frac{1}{\pi} \int_{-\infty}^{\infty} z \frac{(1+iz)^l}{(1-iz)^l} \frac{1}{1+z^2} dz = \zeta_{sn} Z_{l,1} + \operatorname{sgn}(l) \cdot (-1)^l \cdot i, \tag{95}$$

with  $\zeta_{sn} = \frac{\omega - n\omega_{cs}}{k_{\parallel}L_{sz}}$ , p = 0, 1, 2. And we redefine  $Z_{l,0} \equiv Z_l$  for simplify the notation. We have also numerically checked the valid of the above  $Z_{l,p}$  equations for different l. Note also that the final right hand side form is also valid for weak damped  $\operatorname{Im}(\zeta_{sn}) \simeq 0$  mode, since which is naturally analytic continuous for both  $\operatorname{Im}(\zeta_{sn}) > 0$  and  $\operatorname{Im}(\zeta_{sn}) \leq 0$ . They may be not valid for strong damped mode, which is due to that the analytic form of the  $f_{0s}$  is not exactly as the one give by the expansion form. In this work, we hope to solve all the solutions of the dispersion relations, hence we mainly use the above rational form of  $Z_{l,p}$ . It is shown[17] that the rational form is sufficient for weak damped mode, say  $\operatorname{Im}(\zeta) > -2$ . Note also that  $I_{l,0} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{(1+iz)^l}{(1-iz)^l} \frac{1}{1+z^2} dz = \delta_{l,0}$  due to the orthogonal, and  $I_{l,1} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{(1+iz)^l}{(1-iz)^l} \frac{z}{1+z^2} dz$ .

For perpendicular integral

Hence, we have

$$\Gamma_{an,m,p}(a_s) \equiv \frac{1}{L_{sx}^{p+1}} \int_0^\infty v_\perp^p J_n^2(\frac{k_\perp v_\perp}{\omega_{cs}}) f_{s0x,m} dv_\perp = \int_0^\infty x^p J_n^2(a_s x) \frac{(1+ix)^m}{(1-ix)^m} \frac{1}{(1+x^2)^2} dx, \quad (96)$$

$$\Gamma_{bn,m,p}(a_s) \equiv \frac{1}{L_{sx}^{p+1}} \int_0^\infty v_\perp^p J_n(\frac{k_\perp v_\perp}{\omega_{cs}}) J_n'(\frac{k_\perp v_\perp}{\omega_{cs}}) f_{s0x,m} dv_\perp = \int_0^\infty x^p J_n(a_s x) J_n'(a_s x) \frac{(1+ix)^m}{(1-ix)^m} \frac{1}{(1+x^2)^2} dx, \quad (97)$$

$$\Gamma_{cn,m,p}(a_s) \equiv \frac{1}{L_{sx}^{p+1}} \int_0^\infty v_\perp^p J_n'^2(\frac{k_\perp v_\perp}{\omega_{cs}}) f_{s0x,m} dv_\perp = \int_0^\infty x^p J_n'^2(a_s x) \frac{(1+ix)^m}{(1-ix)^m} \frac{1}{(1+x^2)^2} dx. \quad (98)$$

with  $a_s = k_{\perp} \rho_{cs}$ ,  $\rho_{cs} = L_{sx}/\omega_{cs}$ , p = 0, 1, 2, 3. These integral can be calculated numerically. Due to the  $\frac{1}{(1+x^2)^2}$  term, the integral is convergent for even p = 3. Note also  $J_{\alpha}(x) = \sum_{m=0}^{\infty} \frac{(-1)^m}{m!\Gamma(m+\alpha+1)} \left(\frac{x}{2}\right)^{2m+\alpha}$  for small x.

 $A_s = c_{s0} \sum_{l} \sum_{m} a_{s,lm} \left\{ \frac{\omega - k_{\parallel} v_{\parallel}}{\omega} f_{s0z,l} \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m-1} + 2m f_{s0x,m-1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m-1} + 2m f_{s0x,m-1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m-1} + 2m f_{s0x,m-1}] + \frac{i}{2L_{sx}} [(m-2) f_{s0x,m-1}] + \frac{i}{$ 

$$\frac{k_{\parallel}v_{\perp}}{\omega}f_{s0x,m}\frac{i}{2L_{sz}}[(l-1)f_{s0z,l-1} + 2lf_{s0z,l} + (l+1)f_{s0z,l+1}]\Big\},\tag{99}$$

$$B_{s} = c_{s0} \sum_{l} \sum_{m} a_{s,lm} \left\{ \frac{n\omega_{cs}v_{\parallel}}{\omega v_{\perp}} f_{s0z,l} \frac{i}{2L_{sx}} [(m-2)f_{s0x,m-1} + 2mf_{s0x,m} + (m+2)f_{s0x,m+1}] + \frac{i}{2L_{sx}} [(m-2)f_{s0x,m-1} + 2mf_{s0x,m} + (m+2)f_{s0x,m-1}] + \frac{i}{2L_{sx}} [(m-2)f_{s0x,m-1} + 2mf_{s0x,m-1}] + \frac{i}{2L_{sx}} [(m-2)f_{s0x,m-1}] + \frac{i}{2L_{sx}} [(m-2)f_{s0x,$$

$$\frac{\omega - n\omega_{cs}}{\omega} f_{s0x,m} \frac{i}{2L_{sz}} [(l-1)f_{s0z,l-1} + 2lf_{s0z,l} + (l+1)f_{s0z,l+1}] \right\}.$$
 (100)

Note that we have the normalized condition:  $1 = \int_{-\infty}^{\infty} \int_{0}^{\infty} 2\pi v_{\perp} f_{s0} dv_{\perp} dv_{\parallel}$ .

Define

$$\boldsymbol{X}_{sn} = \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi\omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times \begin{bmatrix} A_{s} \frac{n^{2}v_{\perp}}{\mu_{s}^{2}} J_{n}^{2} & iA_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n} J_{n}' & B_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n}^{2} \\ -iA_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n} J_{n}' & A_{s} v_{\perp} J_{n}'^{2} & -iB_{s} v_{\perp} J_{n} J_{n}' \\ A_{s} \frac{nv_{\perp}}{\mu_{s}} J_{n}^{2} & iA_{s} v_{\parallel} J_{n} J_{n}' & B_{s} v_{\parallel} J_{n}^{2} \end{bmatrix}.$$
(101)

We have

$$\begin{split} X_{sn11} &= \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times A_{s} \frac{n^{2} v_{\perp}}{\mu_{s}^{2}} J_{n}^{2} = \frac{n^{2} \omega_{cs}^{2}}{k_{\perp}^{2}} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times A_{s} J_{n}^{2} \\ &= c_{s0} \frac{n^{2} \omega_{cs}^{2}}{k_{\perp}^{2}} \sum_{l} \sum_{m} a_{s,lm} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{\pi \omega dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times \left\{ \\ &\frac{\omega - k_{\parallel} v_{\parallel}}{\omega} f_{s0z,l} \frac{i}{L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] \\ &+ \frac{k_{\parallel} v_{\perp}}{\omega} f_{s0x,m} \frac{i}{L_{sz}} [(l-1) f_{s0z,l-1} + 2l f_{s0z,l} + (l+1) f_{s0z,l+1}] \right\} J_{n}^{2} \\ &= \frac{i}{\pi L_{sz} L_{sx}^{2}} \frac{n^{2} \omega_{cs}^{2}}{k_{\perp}^{2}} \sum_{l} \sum_{m} a_{s,lm} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n\omega_{cs}} \times \left\{ \\ &(\omega - k_{\parallel} v_{\parallel}) f_{s0z,l} \frac{2}{L_{sx}} [(m-2) f_{s0x,m-1} + 2m f_{s0x,m} + (m+2) f_{s0x,m+1}] \\ &+ k_{\parallel} v_{\perp} f_{s0x,m} \frac{2}{L_{sx}} [(l-1) f_{s0z,l-1} + 2l f_{s0z,l} + (l+1) f_{s0z,l+1}] \right\} J_{n}^{2} \\ &= i \frac{n^{2} \omega_{cs}^{2}}{k_{\perp}^{2} L_{sx}^{2}} \sum_{l} \sum_{m} a_{s,lm} \left\{ (\frac{n\omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,0} + I_{l,0}) [(m-2) \Gamma_{an,m-1,0} + 2m \Gamma_{an,m,0} + (m+2) \Gamma_{an,m+1,0}] \right. \\ &+ \Gamma_{an,m,1} \frac{L_{sx}^{2}}{L_{s}^{2}} [(l-1) Z_{l-1,0} + 2l Z_{l,0} + (l+1) Z_{l+1,0}] \right\}, \end{split}$$

and

$$\begin{split} X_{sn33} &= \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n \omega_{cs}} \times B_{s} v_{\parallel} J_{n}^{2} = \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n \omega_{cs}} \times B_{s} J_{n}^{2} \\ &= \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{2\pi \omega v_{\parallel} v_{\perp} dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n \omega_{cs}} c_{s0} \sum_{l} \sum_{m} a_{s,lm} \Big\{ \\ &= \frac{n \omega_{cs} v_{\parallel}}{\omega v_{\perp}} \int_{so_{z,l}}^{\infty} \frac{i}{2L_{sx}} [(m-2) f_{so_{x,m-1}} + 2m f_{so_{x,m}} + (m+2) f_{so_{x,m+1}}] \\ &+ \frac{\omega - n \omega_{cs}}{\omega} \int_{so_{x,m}}^{\infty} \frac{i}{2L_{sz}} [(l-1) f_{so_{z,l-1}} + 2l f_{so_{z,l}} + (l+1) f_{so_{z,l+1}}] \Big\} J_{n}^{2} \\ &= \frac{i}{\pi L_{sz} L_{sx}^{2}} \int_{-\infty}^{\infty} \int_{0}^{\infty} \frac{dv_{\perp} dv_{\parallel}}{\omega - k_{\parallel} v_{\parallel} - n \omega_{cs}} \sum_{l} \sum_{m} a_{s,lm} \Big\{ \\ n \omega_{cs} v_{\parallel}^{2} f_{so_{z,l}} \frac{1}{L_{sx}} [(m-2) f_{so_{x,m-1}} + 2m f_{so_{x,m}} + (m+2) f_{so_{x,m+1}}] \\ &+ v_{\parallel} v_{\perp} (\omega - n \omega_{cs}) f_{so_{x,m}} \frac{1}{L_{sz}} [(l-1) f_{so_{z,l-1}} + 2l f_{so_{z,l}} + (l+1) f_{so_{z,l+1}}] \Big\} J_{n}^{2} \\ &= i \frac{L_{sz}^{2}}{L_{sx}^{2}} \sum_{l} \sum_{m} a_{s,lm} \Big\{ \frac{n \omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,2} [(m-2) \Gamma_{an,m-1,0} + 2m \Gamma_{1n,m,0} + (m+2) \Gamma_{1n,m+1,0}] \\ &+ \Gamma_{an,m,1} \frac{L_{sx}^{2}}{L_{sz}^{2}} [(l-1) Z_{l-1,2} + 2l Z_{l,2} + (l+1) Z_{l+1,2} + (l-1) I_{l-1,1} + 2l I_{l,1} + (l+1) I_{l+1,1}] \Big\} \\ &= i \frac{L_{sz}^{2}}{L_{sx}^{2}} \sum_{l} \sum_{m} a_{s,lm} \Big\{ \frac{n \omega_{cs}}{k_{\parallel} L_{sz}} Z_{l,2} [(m-2) \Gamma_{an,m-1,0} + 2m \Gamma_{1n,m,0} + (m+2) \Gamma_{1n,m+1,0}] \\ &+ \Gamma_{an,m,1} \frac{L_{sx}^{2}}{L_{sz}^{2}} [(l-1) Z_{l-1,2} + 2l Z_{l,2} + (l+1) Z_{l+1,2} + 2i \delta_{l,0}] \Big\}, \end{split}$$

where

$$Q = \sum_{s} Q_{s}, \quad Q_{s} = \frac{\omega_{ps}^{2}}{\omega^{2}} P_{s}, \quad P_{s} = \sum_{n} P_{sn}, \quad P_{sn} = c_{s0} X_{sn}.$$

$$(102)$$

We have used  $(l-1)I_{l-1,1} + 2lI_{l,1} + (l+1)I_{l+1,1} = 2i\delta_{l,0}$ . Here, ' $\rightarrow$ ' means the constant terms  $I_l$  has been summation out for n. We have used  $\sum_{n=-\infty}^{\infty} J_n J'_n = 0$ ,  $\sum_{n=-\infty}^{\infty} nJ_n^2 = 0, \sum_{n=-\infty}^{\infty} nJ_nJ_n' = 0, \sum_{n=-\infty}^{\infty} J_n^2 = 1, \sum_{n=-\infty}^{\infty} (J_n')^2 = \frac{1}{2} \text{ and } \sum_{n=-\infty}^{\infty} \frac{n^2J_n^2}{x^2} = \frac{1}{2}.$ After the above expansion, the dispersion relation Eq.(1) can be readily solved use conventional iterative root

finding method. Since the perpendicular integral  $\Gamma(a_s)$  need only calculate once, and the parallel integrals  $Z(\zeta_{sn})$ are finite rational form, this approach can obtain high accurate solution with less computation cost. The above dispersion relation can also be transformed to matrix method similar to the  $\kappa$  distribution case [14, 13]. We omit the transformation here since it is slightly complicated.
